

## (S)- $\alpha$ -Benzylprolinium *cis*-[(S)- $\alpha$ -benzylprolinato]dichloridopalladium(II)

David B. Hobart Jr\* and Joseph S. Merola

Department of Chemistry, Virginia Tech, Blacksburg, VA 24061, USA

Correspondence e-mail: dhobart@vt.edu

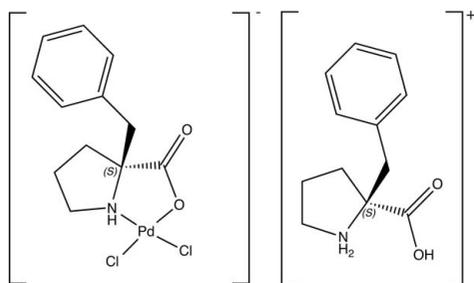

Received 2 April 2013; accepted 8 April 2013

 Key indicators: single-crystal X-ray study;  $T = 100$  K; mean  $\sigma(\text{C}-\text{C}) = 0.005$  Å;  $R$  factor = 0.039;  $wR$  factor = 0.082; data-to-parameter ratio = 26.7.

The title complex salt,  $(\text{C}_{12}\text{H}_{16}\text{NO}_2)[\text{PdCl}_2(\text{C}_{12}\text{H}_{14}\text{NO}_2)]$ , is of interest with respect to organic and organometallic catalysis. The compound crystallizes as very small orange-red irregular prisms and the asymmetric unit contains three crystallographically distinct cation-anion pairs. The coordination geometry about the palladium atoms is square-planar with the chloride ligands *cis* to one another. The structure displays  $\text{N}-\text{H}\cdots\text{Cl}$  and  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonding such that the  $\text{N}-\text{H}\cdots\text{Cl}$  hydrogen bonds align the cation-anion pairs in a linear fashion along [001], with the  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds connecting these linear strands along [100] and [010].

**(S)- $\alpha$ -Benzylprolinium cis-[(S)- $\alpha$ -benzylprolinato]dichloridopalladium(II)**

**David B. Hobart and Joseph S. Merola**

**Comment**

The title compound was isolated as a minor product from a reaction mixture of palladium(II) acetate and S-( $\alpha$ )-benzylproline hydrochloride. The expected product was the bis-amino acid palladium(II) chelate and was indeed formed in good yield. Attempts to crystallize the expected product were successful, however in every instance very small orange-red crystals of the title compound were observed to form along with the expected product.

**Experimental**

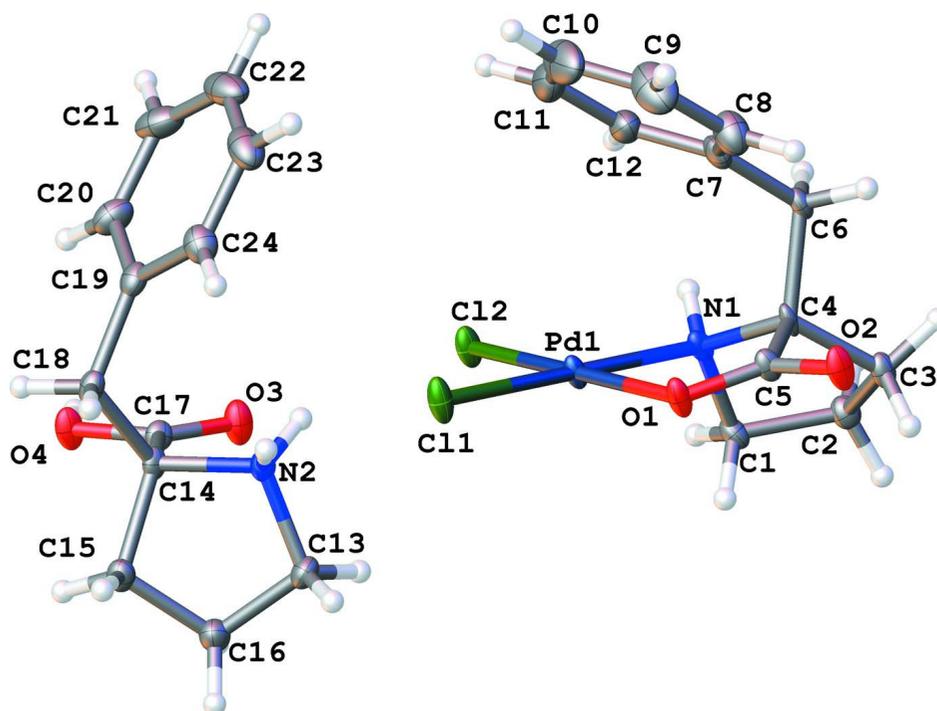

The title compound was isolated as one of two products from a reaction mixture of 0.22 mmol palladium(II) acetate and 0.49 mmol S-( $\alpha$ )-benzylproline hydrochloride in 3 ml of 50/50 (v/v) acetone/water. Single crystals suitable for diffraction were grown *via* slow evaporation from a 50/50 (v/v) solution of acetone and water.

**Refinement**

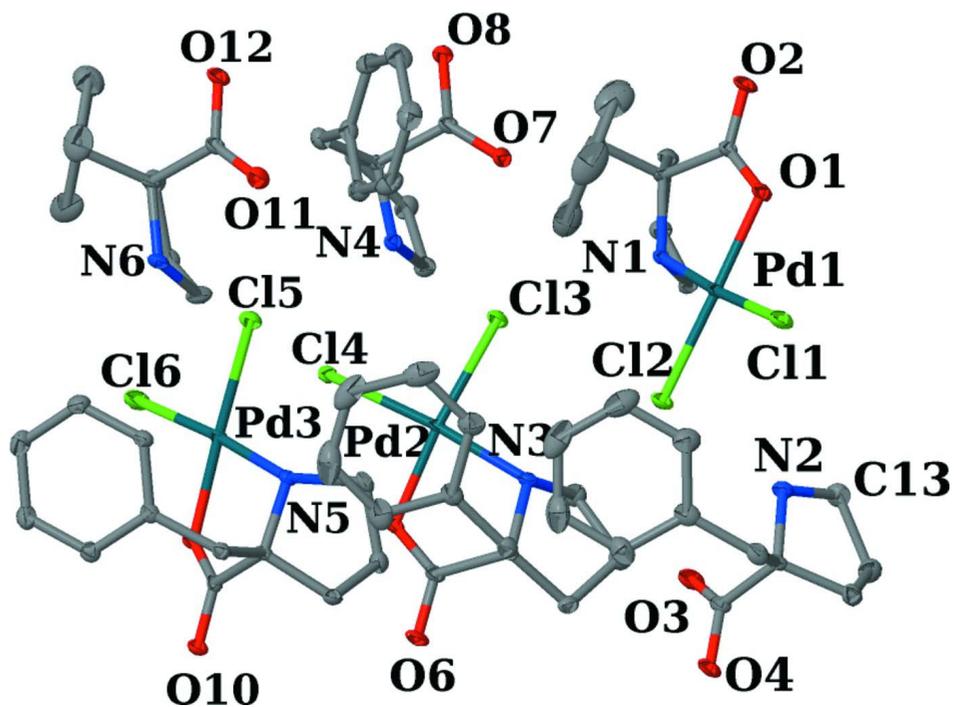

Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

**Computing details**

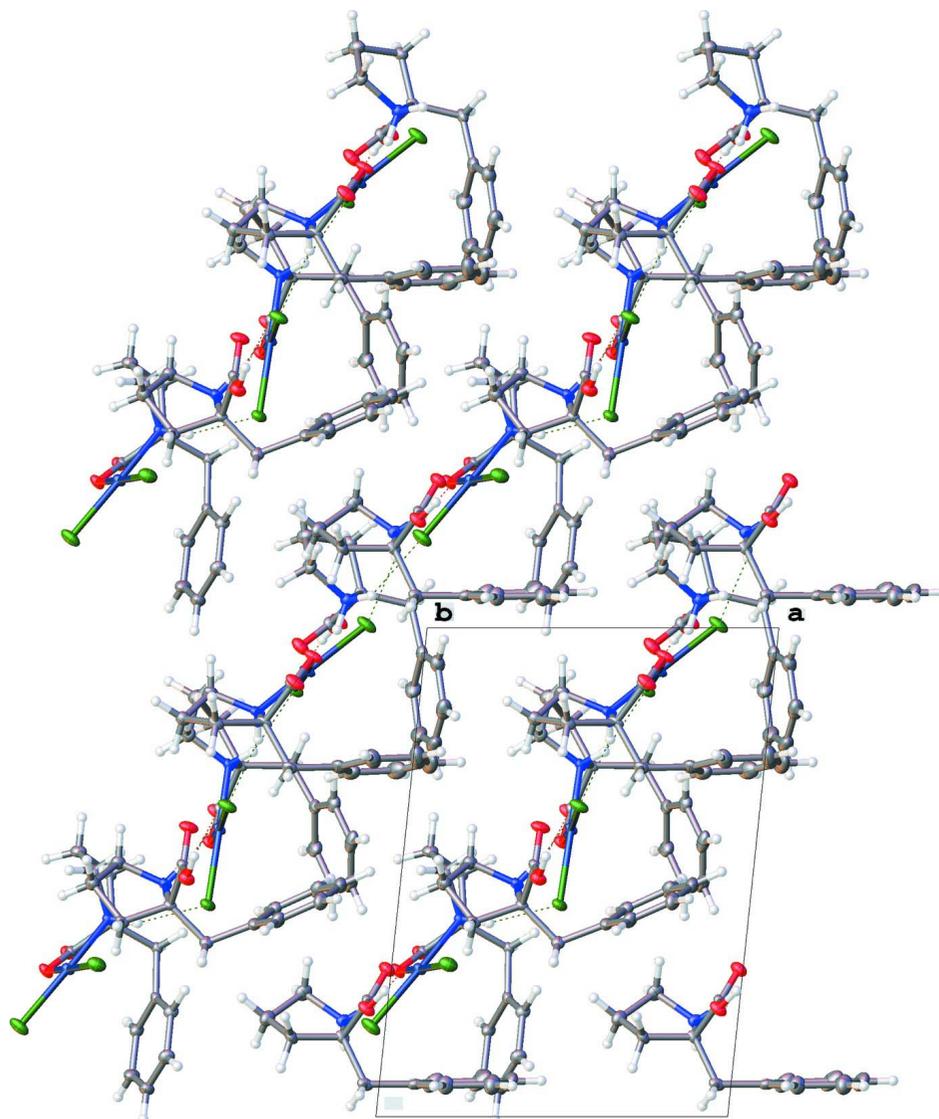

Data collection: *CrysAlis PRO* (Agilent, 2013); cell refinement: *CrysAlis PRO* (Agilent, 2013); data reduction: *CrysAlis PRO* (Agilent, 2013); program(s) used to solve structure: *SHELXS97* (Sheldrick, 2008); program(s) used to refine structure: *SHELXL97* (Sheldrick, 2008); molecular graphics: *OLEX2* (Dolomanov *et al.*, 2009); software used to prepare material for publication: *OLEX2* (Dolomanov *et al.*, 2009).

Primary atom site location: structure-invariant direct methods	Flack parameter: $-0.039$ (12)
Secondary atom site location: difference Fourier map	

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
