T. B. Hutcheson, Dean of Agriculture

THE ADEQUACY OR
INADEQUACY OF THE
POULTRY MARKETING
FACILITIES IN THE
VALLEY OF VIRGINIA

1947

ACKNOWLEDGEMENTS

The author wishes to take this opportunity to express his appreciation to all those who have helped in preparing this thesis.

The author especially wishes to express his sincere appreciation to Dr. J. L. Maxton of the Department of Agricultural Economics for supervising, guiding and directing this study.

The writer also expresses his gratitude to Professor H. L. Moore of the Poultry Department for his assistance and to the managers of the poultry marketing facilities in the Valley of Virginia who gave their time and cooperation.

INTRODUCTION

The first phase of this study is a tabulation of poultry statistics over a period of years so as to determine production, marketing and consumption trends. After a discussion of these trends, the data on the poultry processing plants is presented. Then the adequacy or inadequacy of the plants is determined in the light of the trends in production marketing and consumption of poultry.

The first step in determining the adequacy of the poultry marketing facilities in the Valley of Virginia is to consider the trend in the growth of the poultry industry in Virginia and in the United States over a long period of years. This consideration is necessary in order to determine whether the trend is toward an increase or a decrease in the production of poultry. The increase or decrease will have a direct bearing on the adequacy of the poultry marketing facilities, because if there is a trend toward an increase in growth of the poultry industry, the marketing facilities will have to be increased also. On the other hand, if the trend is toward a decrease in the growth of the poultry industry the marketing facilities will have to be decreased.

Before going further certain terminology should be defined.

1. The "Valley of Virginia" as used in this manuscript refers to the territory included in Rockbridge, Augusta, Rockingham, Shenandoah and Frederick counties.

2. The term "poultry" as used includes only
chickens and turkeys.

PRODUCTION

A. Poultry Production as Compared with the Production of Cattle, Hogs and Sheep.

United States

In order that the growth of the poultry industry may be considered fully, it is necessary that the growth of livestock, which competes with poultry for the producers time and feed as well as for a place on the table of the consumer, be considered also.

The trend in the production of chickens and turkeys as compared with cattle, hogs and sheep in the United States is shown in Table 1. The figures are percentages of the 1929 production and were computed on the basis of pounds live weight produced each year from 1910 through 1945. The year 1929 was used as a base year because of the fact that adequate yearly statistics on turkey production were not available before that year.

Figure 1, which is taken from Table 1, is a graphic presentation of the trend in production of chickens and turkeys as compared with the production of cattle in the United States. The figure covers the period 1910-1945 using 1929 as the base year, other years being expressed in percentages of the 1929 production in pounds live weight. The trend in production of cattle and chickens has been slightly upward with the cattle curve being somewhat smoother than the chicken curve which deviates more sharply. This difference between the two curves may be explained by the fact that

Hogs in the United States, 1910-1945. Expressed on a Per-
centage Basis. 1929 = 100%. (Semi-Logarithmic Scale).

[Source: Table 11.]

it is easier to get in and out of the chicken business than it is the cattle business. Thus, the chicken curve is more variable. The most striking fact about the figure is the steady and high rate of increase in turkey production. Only in the three years, 1934, 1935, and again in 1937, was there any substantial decrease in production under the previous year. Turkey production, during the period 1929-1945, had increased to 252 per cent of its 1929 production in 1945.

In Figure 2 the trend in the production of chickens and turkeys as compared with the production of hogs is shown in percentage of the 1929 production in pounds live weight. In this Figure the chicken and turkey curves are the same as in Figure 1. On the whole there seems to be no great difference in the trend of production of chickens and hogs. Both trends have been slightly upward with hogs remaining above chickens except for the years 1930 and 1934-1937. Turkey production is far above either chickens or hogs.

Virginia

The production of chickens, turkeys, cattle, hogs and sheep on farms in Virginia for the period 1924-1945 is shown in Table 2 on a percentage basis with 1929 as the base year. Figure 3, which is taken from Table 2, gives a graphic presentation of the production of chickens and turkeys as compared with the production of cattle in Virginia. The production of turkeys has been steadily upward except for a slump in production which occurred in 1931.

Turkey production has increased 173 per cent from 1929 to 1945 when 1929 is used as 100 per cent or the base year.

Chicken production has been somewhat unsteady, but the general trend has been upward. The low points were in 1928 and 1940 with 91 per cent of the 1929 production. The high points were in 1936 and 1939 with 142 per cent and 150 per cent, respectively, of the 1929 production.

Cattle production has had a steadier upward trend than chicken production. The low point for cattle production was reached in 1926 with 66 per cent of the 1929 production. The high points were reached in 1943, 1944 and 1945 with 129, 127, and 130 per cent produced, respectively, for those years.

Figure 4 gives a graphic illustration of the production of chickens and turkeys as compared with the production of hogs in Virginia. Hog production has been less variable than chicken production. The general trend has been upward with the low point in 1934 when the production was 80 per cent of 1929 and the high point in 1943 when it was 151 per cent of 1929 production.

B. Chickens: Farm Production Disposition and Income.

United States

The farm production, disposition of chickens, and the income from chickens in the United States for the period 1910-1945 are shown in Table 3. The production over the period 1910-1945 has averaged well over two billion pounds live weight per year. The cash income from the sale of chickens has ranged from almost 120 million dollars in 1912 to over 581 million dollars in 1946. The gross income from chickens in the United States which includes both cash income from sales and the value of chickens consumed has ranged from over 215 million dollars in 1912 to over 771 million dollars in 1945. The peak year for the United States production was 1943 with 131 per cent of the 1929 production and the low year was 1937 with 79 per cent of the 1929 production.

Virginia

Farm production, disposition of chickens, and the income from chickens produced in Virginia for the period 1925-1945 are shown in Table 4. Production in Virginia has ranged from over 47 million pounds in 1925 to well over 77 million pounds live weight in 1943. Cash income from the sale of poultry has ranged from a little over 3 million dollars in 1940 to almost 12 million dollars in 1944. Gross income from chickens in Virginia ranged from over 6 million dollars in 1933 to over 18 million dollars in 1945.

*Production in pounds, 1925-1938, was computed by dividing the farm price per pound into the value of chickens produced.

Source: Agricultural Statistics, 1942-1946
 Virginia Farm Statistics, 1935-1944
 Virginia Farm Economics, May, 1947.

The production of chickens in Virginia is compared with the production of chickens in the United States in Figure 5. The comparison is made in terms of per cent of the 1929 production in live weight with 1929 equal to 100 per cent. There has been considerable variation in the Virginia production from year to year. The general trend, however, in Virginia's production has been toward a greater increase than that of the United States production. The peak year for Virginia production occurred in 1939 with 150 per cent of the 1929 production.

The years of lowest production were 1926 and 1940 with only 91 per cent of the 1929 production.

Figure 5 - Chicken: Production in Virginia in Relation
to Production in the United States, 1925-1945. Ex-
pressed in Per Cent of 1929 Production in Pounds Live
Weight, 1929 = 100%. (Source: Tables 1 and 2).

C. Commercial Broiler Production and Income.

Commercial broiler production is considered separately because their production is not included in the farm production of chickens given in Agricultural Statistics. By "commercial broilers", according to Agricultural Statistics, is meant "young chickens of the heavy breeds, to be marketed at 2 to 4 pounds live weight and from which no pullets are kept for egg production."

United States

Commercial broiler production and income in the United States for the period 1934-1945 are shown in Table 5. Production in terms of numbers has increased from 34 million head in 1934 to 312 million head in 1945, an increase of 817 per cent. Gross income from commercial broiler production has increased from over 18 million dollars in 1934 to over 279 million dollars in 1945.

Virginia

Table 6 shows commercial broiler production and income in Virginia for the period 1934-1945. Production in Virginia has increased from 2 million head in 1934 to over 27 million head in 1945. The gross income from commercial broilers produced in Virginia has increased from over 1 million dollars in 1934 to well over 25 million dollars in 1945.

Figure 6 is a graphic comparison of the growth of broiler production in Virginia with the growth of production in the United

States for the period 1934-1945. The growth is expressed in per cent of the 1934 production in thousand head. The trend in commercial broiler production in both Virginia and the United States has been steadily upward. Only one setback was suffered and that was in 1944 when the number produced over the previous year decreased in both the state of Virginia and the United States. The trend of production in Virginia has been toward a greater increase than has been the trend of the country as a whole. In 1945 , Virginia produced 1,251 per cent more commercial broilers than it did in 1934 while the United States as a whole produced 817 per cent more than it did in 1934.

Head, 1929 = 100%. (Source: Tables 5 and 6).

D. Turkeys: Farm Production, Disposition and Income

United States

Farm production, disposition of turkeys, and income from turkeys in the United States for the period 1929-1945 are shown in Table 7. Turkey production in the United States has increased from 218 million pounds live weight in 1929 to well over 768 million pounds live weight in 1945. Cash income from the sale of turkeys during this period has ranged from over 35 million dollars in 1933 to over 242 million dollars in 1945. Gross income from turkeys during the same period ranged from over 38 million dollars in 1933 to well over 249 million dollars in 1945.

Virginia

Table 8 shows the production, disposition, and income of turkeys in Virginia for the period 1929-1945. Production in terms of pounds live weight has varied from over 6 million pounds in 1931 to 20 million pounds in 1945, an increase of 392 per cent. Cash income from the sale of turkeys in Virginia during the period 1929-1945 has varied from over 1 million dollars in 1933 to over 7 million dollars in 1945.

Gross income was only 85 thousand dollars more than cash income in 1933 and 203 thousand dollars more in 1945, and has followed the same general pattern as the cash income.

In Figure 7 turkey production in Virginia is compared with production in the United States in the period 1929-1945. The comparison is made on a percentage basis expressed in per cent of the

Virginia Farm Statistics, 1944

1929 production in pounds live weight. The year 1929 equals 100 per cent. Virginia turkey production has not kept up with the United States production but the trend for Virginia production has been steadily upward. United States production over the same period has increased 252 per cent over the 1929 production. Virginia production for the same period has increased 173 per cent over the 1929 production.

Figure 7 - Turkey Production in Virginia in Relation to
Production in the United States, 1929-1945. Express-
ed in Per Cent of the 1929 Production in Pounds Live
Weight, 1929 = 100%. (Source: Tables 1 and 2).

E. Poultry Raised in the Valley of Virginia.

Chickens

Production figures of poultry in the five counties which make up the Valley of Virginia were difficult to obtain. For a long time in Virginia poultry was not taxed, therefore, little data were collected on the number of poultry in the various counties of the State. The United States census of agriculture is the only source which gives the number of poultry in the various counties. The census of Agriculture is taken every five or ten years and for this reason may not give a true picture of poultry production because there may be considerable variation in production between the census periods.

Table 9 gives the number of chickens raised in the five counties of the Valley of Virginia by census periods 1919-1944. The total number of chickens raised in the Valley has increased from 1 million head in 1919 to more than 10 million head in 1944. In 1944 the counties in the Valley ranked according to number of chickens raised as follows: Rockingham, first, with almost 6 million head; Shenandoah, second, with over 2 million head; Augusta, third, with well over 1 million head; Frederick, fourth, with 397 thousand head and Rockbridge, fifth, with 220 thousand head.

The percentage of increase in the number of chickens raised in the five counties of the Valley, Virginia, and of the United States is shown in Table 10 for the census periods 1919-1944. The percentages are based on the number raised in 1919, which is equal

Table 9 - Chickens: Number Raised in Five Counties by Census Periods 1919-1944.

County	Census Years

Five Counties	100	126	156	182	426	795
Virginia	100	112	118	116	155	241
United States	100	115	142	127	140	186

Source: Computed from Appendix A, Table 4.

to one hundred per cent. In 1944 the Valley increased production 695 per cent over its 1919 production while the State as a whole produced only 141 per cent and the whole country 56 per cent more.

Figure 8 is a graphic presentation of Table 10. The tremendous increase in the production of chickens in the five counties of the Valley is immediately apparent. The general trend in Virginia production of chickens has been toward a greater increase than has been the trend in the United States, but at the same time it has been less of an increase than the increase in the Valley of Virginia.

Turkeys

In Table 11 may be seen the number of turkeys in the five counties of the Valley of Virginia as reported by the census for the years 1929, 1939, and 1944. The total number raised in the five counties has increased from 68,788 in 1929 to 387,044 in 1944, an increase of 463 per cent. The rank of the five counties in number of turkeys raised in 1944 was as follows: Rockingham, first, with 260 thousand head; Shenandoah, second, with 60 thousand head; Augusta, third, with 54 thousand head; Frederick, fourth, with 8 thousand head and Rockbridge, fifth, with 3 thousand head.

Percentage of increase in number of turkeys raised in the five counties of the Valley, Virginia and the United States as reported by the census for the years 1929, 1939 and 1944 is shown in Table 12. The percentages are based on the number raised in 1929, which is equal to 100 per cent. In 1944 the Valley produced 463 per cent more than in 1929, while Virginia produced only 44 per cent more and the country as a whole produced 114 per cent more.

F. Poultry production in Rockingham County.

The poultry raised in the five counties of the Valley expressed as a percentage of the total poultry produced in the State of Virginia is shown in Table 13. In 1944 almost 30 per cent of the chickens and 51 per cent of the turkeys raised in Virginia were raised in the Valley.

Rockingham County is the most important county in the Valley in poultry production. The poultry raised in Rockingham County expressed as a percentage of the total poultry raised in the five counties of the Valley and in the State of Virginia as a whole is shown in Table 14. In 1944 nearly 58 per cent of the chickens and 67 per cent of the turkeys raised in the Valley were raised in Rockingham County. Rockingham County raised 17 per cent of the chickens and 34 per cent of the turkeys that were raised in Virginia in 1944.

A consideration of some of the causes of the rapid growth of the poultry industry in Rockingham county should throw some light on the growth of the poultry industry in the Valley as a whole.

The April, 1945, issue of the Monthly Review of Financial and Business Conditions published by the Federal Reserve Bank of Richmond had this to say about the development of the poultry industry in Rockingham county:

The development of an important poultry industry in this county has taken place within the fifteen year period between 1928 and 1944, with the principal expansion occurring in the past five years.

The development of a poultry industry of the present magnitude in this county may be attributed to a number of

different factors, some of which are peculiar to the area. The principal factors, in approximate order of importance, contributing to the growth of the industry in this area include:

1. The thrifty and industrious nature of the people in this county, many of whom are members of the Mennonite faith. Poultrymen in the area contend that this is probably the most important single factor contributing to the growth of the industry, particularly under the contract feed system. The successful development of poultry is to a great extent a matter of effort expended, so that the importance of a large supply of industrious farm labor is readily apparent. In addition, honesty and integrity are essential to the operation of the "shares" system.
2. The method of "shares" contracting, worked out by the various feed mills with the farmers. Under this method the farmer is relieved of the necessity of furnishing his capital and of absorbing losses.
3. The proximity to markets along the eastern seaboard is another important contributing factor. The poultry products can be hauled overnight to most of the major eastern terminal markets, thus giving the area competitive advantage over the midwestern producing areas, since the eastern markets, particularly the New York market, are the principal poultry markets.

4. The decline of the lumber industry and the subsequent impoverishment of certain sections in the northwestern part of the county resulted in farmers in these sections turning to poultry raising as a source of income. In the early thirties a great proportion of these people were on relief, and dependent for subsistence on gardens, perhaps a few laying hens, etc. In turning to poultry raising these farmers have been rendered economically independent, thus benefiting the entire area.
5. Another factor, particularly instrumental in the above noted conversion of farmers in this so-called "Brooks Gap" area to poultry raising and in the development of the "shares" system, was the concerted action of a small group of individuals headed by the then county agent.
6. A final factor, of diminishing importance with the introduction of scientific feeding and breeding, is the general topography of the country which consists of rolling, limestone land. This rolling country assists in the provision of proper drainage of the poultry range, while the limestone is considered of some value in building the bone of the fowl.

MARKETING

A. Prices

Chickens

Estimated prices of chickens per pound live weight received by farmers in the United States as of the fifteenth of the month for the period 1929-1946 are shown in Table 15. The average of the monthly prices shows that December and February were the months of lowest price averaging 16.5 cents per pound and 16.9 cents per pound respectively. The peak months were July and September, both averaging 17.9 cents per pound*. On a yearly basis prices paid farmers per pound live weight in the United States varied from 9.5 cents in 1933 to a peak of 26.8 cents in 1946.

Table 16 gives the estimated farm price per pound live weight paid to Virginia farmers for chickens as of the fifteenth of the month for the period 1929-1946. The monthly average shows that the lowest price was received in January when only 18.5 cents was received per pound. The peak averages were for the months of June and July when 21.2 cents per pound for both months was received. The average price per year received by farmers in Virginia for chickens has varied from a low of 11.9 cents in 1933 to a peak of 30.8 cents per pound received in 1946.

Figure 9 gives a comparison of the average monthly farm price per pound live weight received by farmers for chickens in the United States and in Virginia for the period 1929-1946. The monthly Virginia farm price has followed the same general trend

*The average prices shown in Tables 15, 16, 20 and 21 are simple monthly averages with no attempt made to calculate seasonal variation.

Figure 9 - Chickens: Average Prices Received Per Pound Live
Weight by Farmers in the United States and Virginia as of
the 15th of the Month for the Period, 1929-1946. (Source:
Tables 15 and 16).

as the United States farm price. Over this period of time, however, Virginia farm prices for chickens have been well above United States prices. Monthly Virginia farm prices for the period 1929-1946 averaged 19.9 cents per pound live weight while those for the United States for the same period averaged 17.3 cents per pound live weight. Virginia farmers received 2.6 cents more per pound live weight over this period for their chickens than did the United States farmers as a whole.

In Figure 10 is shown the average price per year received for chickens by farmers in the United States and in Virginia for the period 1929-1946. The Virginia farm price has followed the same general pattern as the United States farm price. Virginia prices have remained above United States prices to the extent of 2.6 cents per pound live weight. The trend in prices received by farmers for chickens has been generally upward since 1933.

Table 17 gives the wholesale price per pound live weight at Chicago of different market classes of chickens for the period 1935-1945. Heavy roasters (over 4 pounds) including both white Rock and colored have averaged 22.5 cents per pound live weight wholesale on the Chicago market. Light roasters (under 4 pounds) have averaged 22 cents per pound live weight. Broilers averaged 21.3 cents per pound while fowl have averaged 19.2 cents per pound for the same period.

The wholesale price per pound dressed weight of different market classes of chickens on the New York market for the period 1935-1945 is shown in Table 18. Fowl fresh dressed or frozen,

fancy box packed have averaged 25.3 cents per pound over the period 1935-1945. Young chickens fresh-dressed, fancy, in barrels have averaged 28.5 cents per pound dressed weight on the New York market. Young chickens, fresh-dressed and frozen, fancy box packed for the period 1935-1945 have averaged 28.2 cents per pound wholesale on the New York market. Young chickens packed in barrels brought 0.3 cents more per pound.

Table 19 shows the prices paid to producers for various farm products in Virginia including milk, butter, milk cows, eggs, chickens, beef cattle, sheep, lambs, wool and hogs. The prices are indicated in index numbers 1910-1914 = 100 for the period 1928-1946. An average index number for the period 1928-1946 shows that chickens ranked fifth along with milk in prices paid to producers. The average index numbers for products for the above period ranked as follows: lambs, first, 163; milk cows, second, 156; wool, third, 155; beef cattle, fourth, 154; milk, fifth, 145; chickens, sixth, 145; hogs, seventh, 128; butter, eighth, 121; eggs, ninth, 112; and sheep, tenth, 97. The average index number for the period 1931-1936, which was a period of relatively low prices, shows that chickens ranked second in the ten products listed in terms of prices paid to producers. For the above period the average index number for prices paid to producers for chickens was 110 and was exceeded only by milk which had an average index number of 117. For the period 1941-1946 which was a period of relatively high prices, the average index numbers of prices paid to producers show chickens ranking fifth. The products ranked were as follows: milk cows, first, 231; beef cattle, second, 227; lambs, third, 223; wool, fourth, 218; chickens, fifth, 183; hogs, sixth, 181; milk, seventh, 180; butter, eight, 165; eggs, ninth, 150; and sheep, tenth, 122. It appears that the prices paid producers for chickens are relatively higher than those paid for the products listed in periods of low prices.

Turkeys

Table 20 shows the estimated prices per pound live weight received for turkeys by farmers in the United States as of the fifteenth of the month for the period 1929-1946. A monthly average was calculated for the period 1938-1946 because comparable data on Virginia farm prices was available for this period only. During the period 1938-1946 the lowest average price received by farmers in the United States for turkeys was 21.2 cents per pound live weight in the month of May. The peak month was December when the farm price of the United States averaged 26.4 cents. The average yearly price for the period 1933-1946 for which complete data are available has ranged from a low of 10.6 cents live weight in 1933 to a high of 33.4 cents per pound received in 1946.

Estimated prices per pound live weight received by farmers for turkeys in Virginia as of the fifteenth of the month for the period 1929-1946 are shown in Table 21. The average monthly price for the period 1938-1946 for which complete data are available has ranged from a low of 24.2 cents live weight to a high of 28.3 cents per pound in December. The average yearly price received by farmers in Virginia for turkeys has ranged from a low of 16.8 cents live weight received in 1940 to 35.9 cents per pound received in 1945.

Figure 11 shows the average estimated prices received per pound live weight for turkeys by farmers in the United States and in Virginia as of the fifteenth of the month for the period

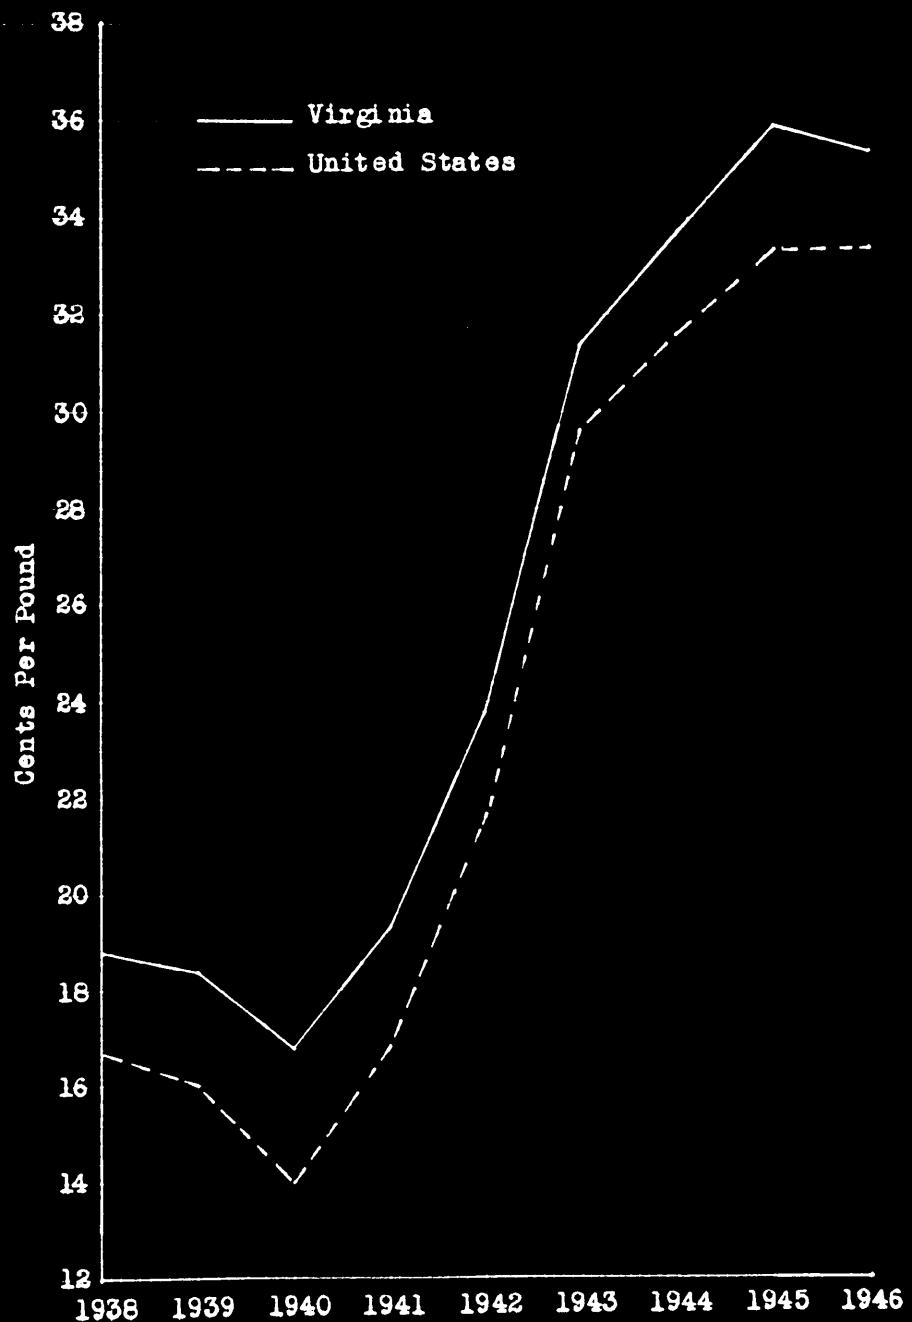

Figure 11 - Turkeys: Average Estimated Prices Received per Pound
Live Weight by Farmers in the United States and Virginia as
of the 15th of the Month for the Period 1938-1946. (Source:
Tables 20 and 21).

1938-1946. For this period Virginia prices declined after January, reached a low point in June, then advanced to a peak in December. United States prices declined after January, reached a low point in May and advanced to a peak in December. For the period 1938-1946 Virginia farm prices for turkeys averaged 2.7 cents per pound live weight more than United States turkey farm prices.

Average yearly estimated farm prices received by farmers for turkeys per pound live weight in the United States and in Virginia for the period 1938-1946 are shown in Figure 12. Both curves reach their low points in 1940; Virginia prices, however, reached their high point of 35.9 cents per pound live weight in 1945 while United States prices reached their high point of 33.4 cents in 1946. The trend in both United States and Virginia farm prices has been steadily upward since 1940 with Virginia prices remaining an average of 2.7 cents per pound live weight above United States Prices.

Figure 12 - Turkeys: Average Estimated Prices Per Pound
Live Weight Received by Farmers in the United States
and in Virginia, 1938-1946. (Source: Tables 20 and
21).

B. Market Receipts.

Table 22 gives the live poultry receipts of three markets by rail and truck for the period 1936-1945. In general, live receipts of poultry have been decreasing during the period 1936-1945. In the New York market, for instance, total live receipts were 151 million pounds in 1937 and about 107 million pounds in 1945. The New York market indicates that the motor truck is gaining in importance in the transporting of live poultry. The motor truck receipts of live poultry in this market increased from about 76 million pounds in 1936 to over 117 million pounds in 1943. Motor truck receipts of live poultry have suffered some set back in 1944 and 1945, due to wartime shortages and Office of Defense Transportation regulations.

Live poultry receipts in six markets by rail and truck for the period 1936-1945 are shown in Table 23. In general, truck receipts of live poultry have tended to fall off in the last three or four years of the period 1936-1945. One exception, however, to this trend is the fact that in the San Francisco market truck receipts of live poultry, except for the year 1943, have steadily increased. In the New York market during the period 1936-1945 rail receipts reached a low point in 1941 when 114 million pounds of dressed poultry and a high point in 1945 when over 212 million pounds were received. Truck receipts for the same period in the New York market started at a low point of 39 million pounds in 1936 and increased to a high point of 137 million pounds in 1942, then dropped to 83 million pounds dressed weight in 1945.

Table 24 shows the total live and dressed poultry receipts in three markets for the period 1930-1945. It is obvious from this Table that the trend in receipts of live poultry has been downward while the trend in receipts in dressed poultry has been upward. A graphic presentation of this Table is given in Figure 13, which gives the total live and dressed poultry receipts in three markets for the period 1930-1945 expressed in terms of percentages of the 1930 receipts in pounds of live and dressed weights, respectively. The trend in total receipts of live poultry has been steadily downward in the three markets decreasing from over 302 million pounds in 1930 to about 157 million pounds in 1945, a decrease of 48 per cent. The trend in total receipts of dressed poultry in the three markets has increased since 1935 when the receipts totaled 233 million pounds except for one year, 1943, when there was one large set back, to over 444 million pounds in 1945, an increase of 53 per cent.

Figure 13 - Poultry: Total Live and Dressed Receipts in Three Markets for the Period 1930-1945. Expressed in Per Cent of the 1930 Receipts in Pounds Live and Dressed Weight Respectively, 1930 = 100%. (Source: Table 24).

C. Cold-Storage Holdings.

Cold-storage holdings of all classes of poultry in the United States as of the first of the month for the period 1921-1941 is shown in Table 25 in terms of million pounds. A graphic presentation of the average monthly cold-storage holdings of poultry in the United States for the period 1921-1941 is given in Figure 14 which is taken from Table 25. Cold-storage holdings for the period averaged 127 million pounds in the peak month of January, then steadily declined to 47 million pounds in the low months of August and September then rose steadily to an average of 101 million pounds in the month of December.

Figure 15, which is also taken from Table 25, gives a graphic presentation of the average monthly cold-storage holdings per year for the period 1921-1941. There have been considerable yearly fluctuations in the average monthly poultry cold-storage holdings during the period. Exceptions are the years 1931, 1932 and 1933 when the monthly averages for the year were 65, 65 and 66 million pounds, respectively. The general trend in average monthly cold-storage holdings for the year during the period 1921-1941 has been steadily upward varying from a low of 48 million pounds in 1921 to a high of 127 million pounds in 1941, an increase of 164 per cent. The straight line trend given in the Figure shows that the average monthly cold-storage holdings increased from 55 million pounds in 1921 to 100 million pounds in 1941, a rate of increase of $2\frac{1}{2}$ million pounds per year over the period 1921-1941.

Formula used to compute straight line trend

$$Y = a + bx$$

$$Y = 27.48 + 2.26x$$

CONSUMPTION

Table 26 shows chicken consumption in the United States in terms of pounds dressed weight for the period 1930-1945. The lowest per capita consumption of poultry was reached in 1938 when 16.8 pounds per person were consumed. The highest per capita consumption was reached in 1943 when 28 pounds of chicken per person were consumed.

The total and per capita consumption in pounds dressed weight of turkeys in the United States for the period 1930-1945 is shown in Table 27. For the period 1930-1945 per capita consumption of turkeys in terms of pounds dressed weight has increased from 1.7 pounds in 1931 to 4.3 pounds in 1945.

A comparison of the per capita consumption of chickens and turkeys with the per capita consumption of beef, veal, lamb, mutton, and pork for the period 1910-1945 is given in Table 28. A graphic presentation of the above Table is given in Figure 16. The Figure gives the per capita consumption of chickens and turkeys as compared with other meats which include beef, veal, lamb, mutton and pork. The comparison is made on a percentage basis and is expressed in terms of per cent of the 1929 per capita consumption in pounds. The year 1929 was used as a base year because data on turkey consumption were not available before that year. The most striking fact about this figure is the increase in the per capita consumption of turkeys over the period, 1929-1945. In 1945 the per capita consumption of turkeys was 145 per cent above the 1929

Figure 16 - Consumption of Chickens and Turkeys as Compared With the Consumption of All Meats, Including Beef, Veal, Lamb, Mutton and Pork, in the United States for the Period 1910-1945. Expressed on a Percentage Basis. 1929 = 100%. Semilogarithmic Scale. (Source: Appendix A, Table 5).

per capita consumption. Per capita consumption of chickens as compared to other meats has been holding its own over the period 1910-1945 and since 1942 has increased well above the consumption of all other meats. This increase in chicken consumption in relation to other meats may be due to the fact that chicken production has had a large increase in the last few years. For instance, total production in pounds dressed weight was 2,988 million pounds in 1942, (Table 26), and 3,700 million pounds in 1945, an increase of 712 million pounds. Also, chicken imports increased from 2 million pounds dressed weight in 1943 to 22 million pounds in 1945 while chicken exports increased from 1 million pounds dressed weight to only 11 million pounds in 1945. Thus chicken imports have been increasing more rapidly than exports in the last few years.

POULTRY MARKETING FACILITIES IN THE VALLEY OF VIRGINIA

A. Description of Facilities and Area Studied.

Location

The area included in this study is shown in Figure 17 and includes the five counties of Rockbridge, Augusta, Rockingham, Shenandoah, and Frederick. This area included in these five counties is known as the Valley of Virginia and has been referred to before in this manuscript.

Figure 18 gives the location of the marketing facilities studied within the five counties of the Valley of Virginia. The facilities are located as follows: Rockbridge County, one, located in Lexington; Augusta County, four, one at Moffatts Creek, one at Stuarts Draft and two in Stuanton; Rockingham County, two, one in Harrisonburg and one at Timberville; Shenandoah County, three, one at New Market, one at Edinburg and one at Toms Brook; Frederick County, two, located in Winchester.

Method Used In Study

The method for determining the marketing facilities used in this study was to personally interview the manager of the processing plant or person in charge of the establishment and secure data by filling out a questionnaire. A copy of the questionnaire used in the study is shown in Appendix B of this manuscript. Twelve facilities in all were visited, however, these marketing facilities are not homogeneous throughout and may be grouped as follows:

Figure 17 - Area Included in Study and Additional Area Served by Marketing Facilities.

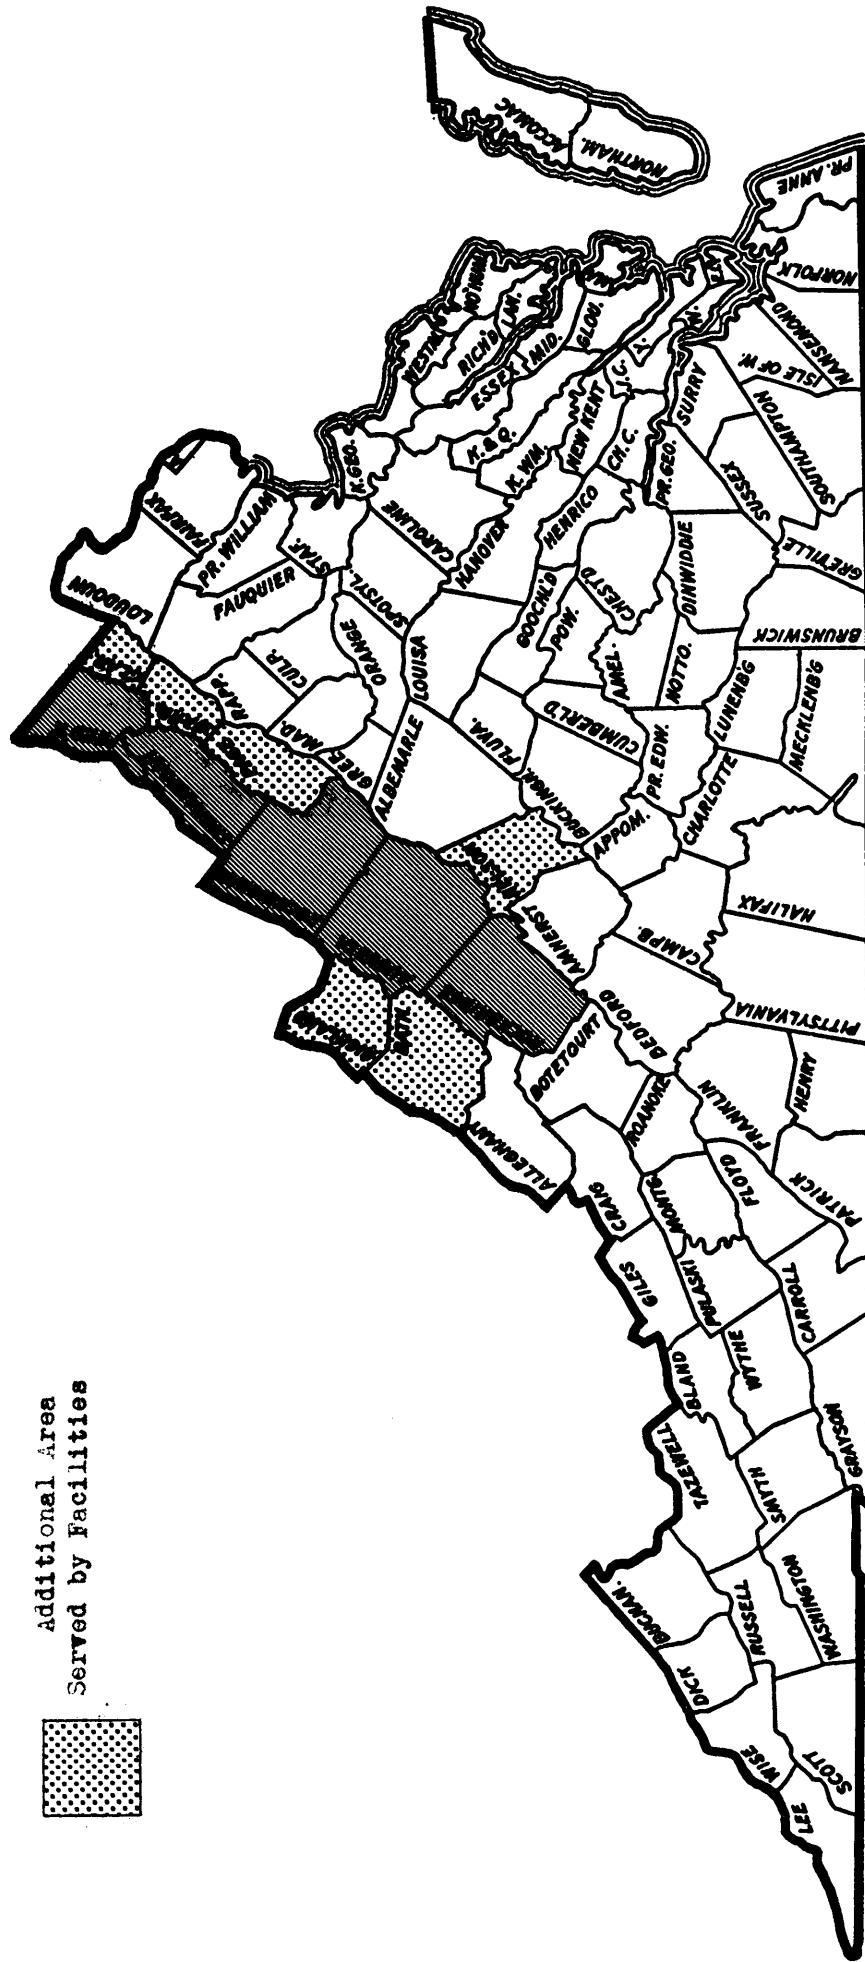

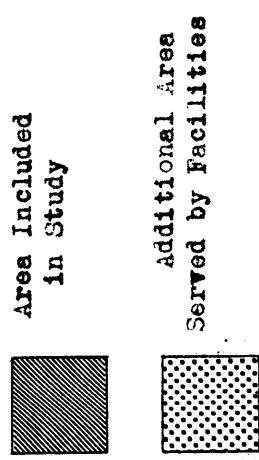

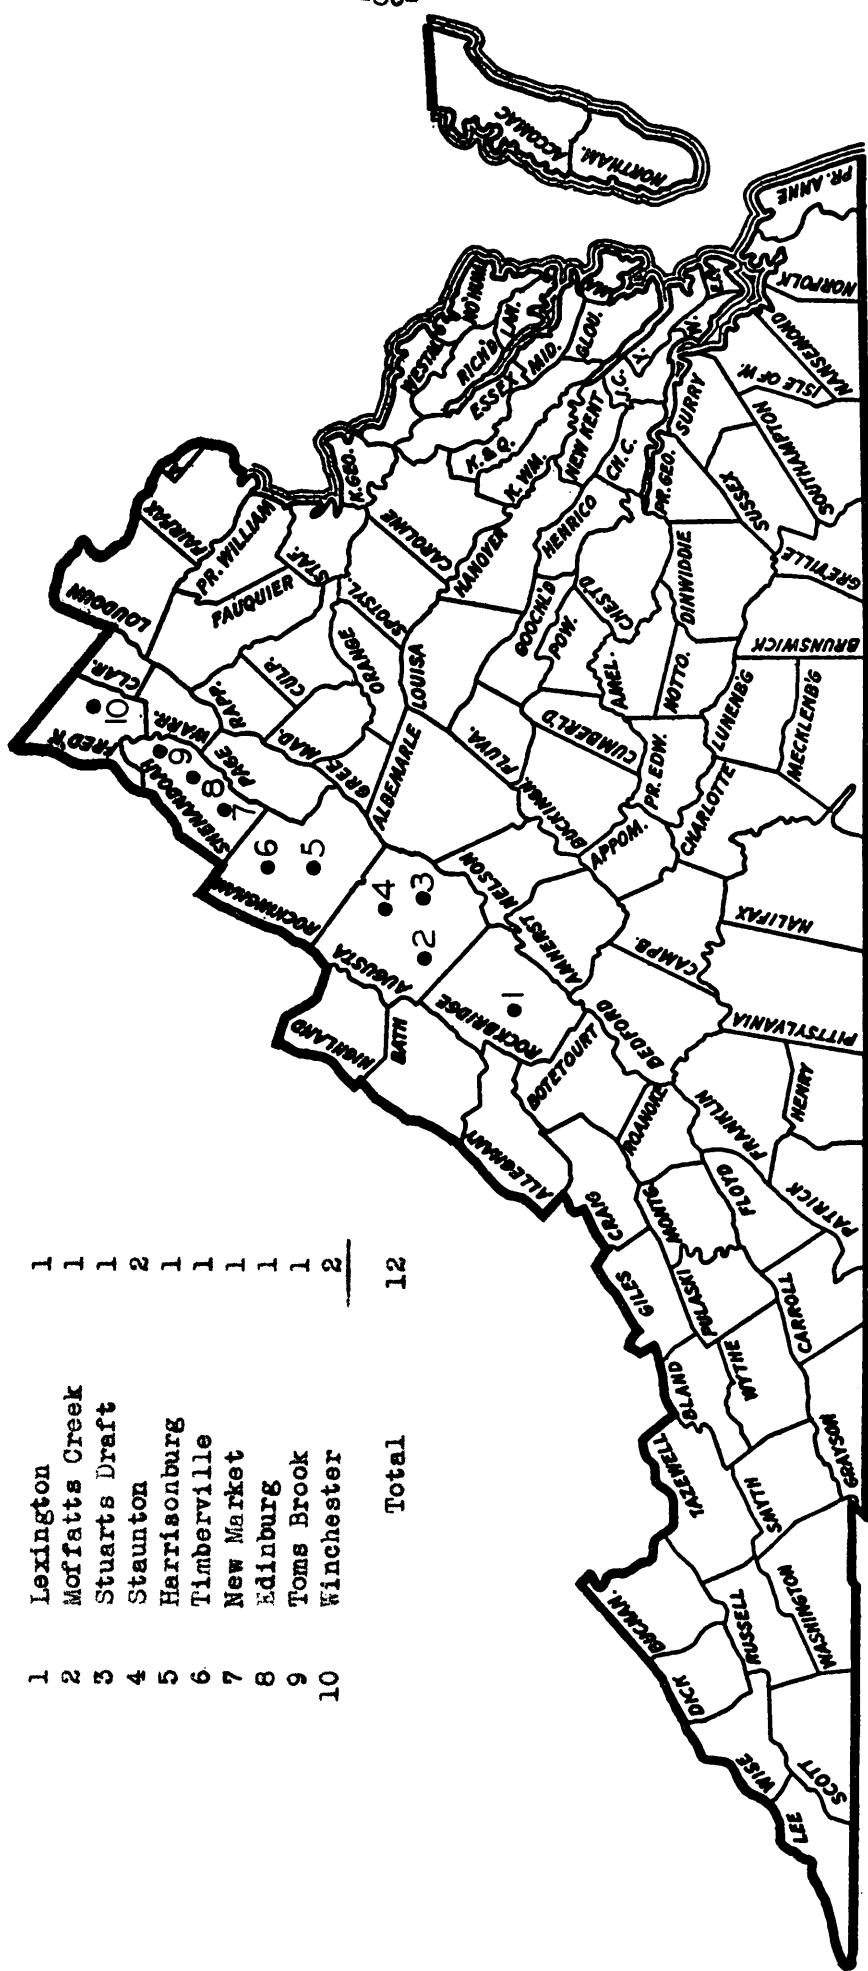

Figure 18 - Location of Marketing Facilities
Studied.

Location Number of
 Facilities

1 Lexington	1
2 Moffatt's Creek	1
3 Stuarts Draft	1

5 Harrisonburg	1
6 Timberville	1
7 New Market	1
8 Edinburg	1
9 Toms Brook	1
10 Winchester	2
Total	12

-86-

1. Two producers were interviewed. One of these producers had a retail license, and he purchased, dressed, and sold chickens and turkeys in addition to those produced on his farm.
2. A second group included a dealer who purchased chickens and turkeys, selling some live and some dressed. He had no means of dressing poultry at his establishment and employed some of the processing plants to dress his poultry.
3. Processing plants:

- (a) Three plants were small establishments without conveyor systems.
- (b) Six of the plants were large establishments with conveyor systems and modern machinery.

This made it difficult to make comparisons when there were such great differences in number of people employed, floor space, and investment. The average investment of seven of the plants on which data were obtained amounted to \$135,203 which included real estate, machinery, equipment and trucks.

Physical Make-Up of Facilities

There was considerable variation in the size of the twelve facilities studied. The small establishments had one floor. The larger ones had two floors, the upper floor being used for holding and feeding the live poultry and the lower used in the actual processing. The average number of floors for all twelve establishments was 1.6

Table 29 gives the number of workers employed and floor space by groups for the establishments studied. For the purpose of analysis, the establishments were grouped as follows:

1. Producers and dealer:
 - (a) Two producers are included in this group.
 - (b) One dealer is included in this group.
2. Three processing plants not having conveyor systems were included in a second group.
3. Six processing plants having conveyor systems were included in a third group.

Table 29 - Number of Workers Employed and Floor Space by Groups for the Establishments Studied.

Group	Number of Establishments in Group		Number of Workers Employed		Floor Space		Average Floor Space Per Worker
	Number	Total Number	Average Number	Total Sq. Ft.	Average Sq. Ft.	Sq.Ft.	
Producers & Dealer	3	11	3.7	1,601	534	146	
Processing plants not having conveyor systems	3	29	9.6	4,720	1,573	163	
Processing plants having conveyor systems	6	400	66.7	141,257	23,543	353	
All establishments	12	440	36.8	147,578	12,298	335	

The average number of workers per establishment was determined by dividing the total number of workers employed in each group by the number of establishments within the group. The producers and dealer group employed an average of 3.7 workers per establishment, while processing plants not having conveyor systems employed an average of 9.6 workers per establishment and plants having conveyor systems employed an average of 66.7 workers per establishment. While these numbers of workers per establishment may seem small, it must be remembered that at the time of the study the establishments were only operating at 51 per cent of their total capacity.

The variation in the size of facilities may be seen in the average floor space per facility for the different groups shown in Table 29. For instance, the producers and dealer group had an average of 534 square feet per facility, while the processing plants not having conveyor systems had 1,573 square feet per plant and those plants having conveyor systems had 23,543 square feet of floor space per facility.

The average floor space per worker was determined by dividing the total number of workers employed (when the plants were operating at 51 per cent of maximum capacity per 8-hour day) by each group into the total floor space for each group. Floor space per worker for the different groups was as follows: producers and dealer group, 146 square feet per worker; processing plants without conveyor systems, 163 square feet per worker; and plants with conveyor systems 353 square feet per worker. This wide difference in floor space per worker may be due to the fact that the larger establishments had feeding rooms for

finishing poultry, while many of the smaller establishments did not. Also, the plants were operating at 51 per cent of their maximum capacity, which fact would make the average floor space per worker much larger than it would be if the plants were operating at full capacity with a large number of workers employed.

In regard to the possibility of expanding or contracting their present facilities, seven out of nine said their establishments could easily be enlarged. However, nine out of eleven said that they did not have any plans to expand their present establishments.

B. Purchases.

Sources of Supply

Purchases for six of the large plants on which data were obtained averaged 3,965,273 pounds live weight of poultry per plant for the year 1946. The facilities in the Valley not only serve the five counties of the Valley, but in addition they serve Highland, Bath, Nelson, Page, Warren and Clark counties in Virginia, and Hardy and Pendleton counties in West Virginia. The counties served by these facilities in addition to the counties served in the Valley are shown in Figure 17.

Prices Paid by Facilities

Table 30 shows the average prices paid per pound live weight for different market classes of poultry by the marketing facilities studied for the year 1946. The average prices paid per pound live weight by market classes were as follows: broilers, 32.6 cents; roasters, 36 cents; cocks, 15 cents; fowl, 28.6 cents; turkey hens, 31.8 cents and turkey toms, 26.4 cents per pound.

Table 30 - Average Prices Paid per Pound
Live Weight for Different Market Classes
of Poultry by Marketing Facilities
of the Valley for the Year 1946.

Market Class	Average Price Paid per Pound Cents
Broilers	32.6
Roasters	36.0
Cocks	15.0
Fowl	28.6
Turkey(Hens)	31.8
Turkey(Toms)	26.4

The market classes used in this study are defined in Farmers Bulletin, No. 1377, published by the United States Department of Agriculture, as follows:

1. "Broilers (in Virginia same definition as on Page 21) are young chickens, approximately 8-12 weeks old, of either sex, of marketable age but not weighing over $2\frac{1}{2}$ pounds each or 30 pounds a dozen, and sufficiently soft-meated to be cooked tender by broiling. The lighter weights are sometimes quoted as squab broilers."
2. "Roasters are young chickens, approximately 5-9 months old, of either sex, weighing over $3\frac{1}{2}$ pounds each or over 42 pounds a dozen, and sufficiently

soft-meated to be cooked tender by roasting."

3. "Cocks are mature male birds of any weight with darkened and toughened flesh. Sometimes they are quoted as old roosters."
4. "Fowl are mature female birds of any age or weight. They are generally divided into several sub-classes according to weight, and the lighter weights usually bring a lower price."
5. "Turkeys are commonly quoted as young and old and as hens or toms. Old turkeys are those over 1 year old with toughened flesh and hardened breastbone. Turkeys classed as young are usually less than 1 year old, are soft-meated, and have flexible breastbones. Young turkeys generally sell for the higher price, followed in order by old hens and old toms."

Table 31 gives the average prices received by farmers in Virginia and in the United States per pound live weight for the year 1946. In that year Virginia farmers received 4.0 cents per pound live weight more for their chickens and 2.0 cents per pound more for their turkeys than did farmers in the country as a whole. Comparable data on prices for farmers in the Valley could not be determined because a number of the facilities studied were cooperative organizations and as such they distribute patronage refunds to their patrons at the end of the year. These refunds are based on the amount of business that the patron does with his cooperative,

Table 31 - Prices Received by Farmers in Virginia in Relation to Prices Received by Farmers in the United States per Pound Live Weight for Chickens and Turkeys for the Year 1946.

Division	Prices Paid	
	Chickens Cents	Turkeys Cents
To farmers in Virginia	30.8	35.4
To farmers in the United States	26.8	33.4
Difference	4.0	2.0

Source: Tables 15, 16, 20, and 21.

and, therefore, the patron may get more for his poultry than the average prices paid by the facilities would indicate.

Seasonality

All the facilities studied reported that they operated the year round. In general, the facilities reported that they received their largest number of young chickens in the spring and their largest number of older chickens in the winter. The largest number of turkeys is received in the months of October, November, and December. This is in keeping with Table 32 which shows the proportion of the turkey crop marketed in different months. In 1946 nearly 45 per cent of the turkey crop in the South Atlantic States, which includes Virginia, was marketed in the month of November.

Table 32 - Proportion of Turkey Crop Marketed
in Different Months.

C. Processing Capacity and Cost of Processing.

Finishing

Only the larger plants did any finishing and in these plants the birds were held for an average of two days. The birds were held in batteries and fed a wet mixed feed in troughs. Some of the smaller plants that did not finish their poultry paid the producers a premium of 3 cents per pound live weight for birds that had been fattened on the farm or were in very good condition at the time of their purchase.

Capacity of Facilities

Table 33 gives the total maximum capacity and average maximum capacity by groups for the twelve facilities studied on the basis of pounds dressed weight per 8-hour day. All capacities were brought to this common denominator of pounds dressed per 8-hour day by using an average weight of 3 pounds per head for broilers, 5 pounds per head for fowl and 15 pounds per head for turkeys and assuming a 10 per cent shrink.

There was considerable variation between the different groups of facilities in average maximum capacity dressed weight per 8-hour day. The producer and dealer group had an average maximum capacity of 1,026 pounds dressed weight of broilers per 8-hour day or 1,274 pounds of fowl or 1,187 pounds of turkey. The processing plants not having conveyor systems had an average maximum capacity of 4,268 pounds dressed weight of broilers per 8-hour day or 7,639 pounds of fowl or 4,703 pounds of turkey.

Plants having the conveyor system had an average maximum capacity of 19,750 pounds dressed weight of broilers per 8-hour day or 46,749 pounds of fowl or 46,855 pounds of turkey. The overall average maximum capacity per 8-hour day for the twelve facilities was 11,976 pounds of broilers or 25,603 pounds of fowl, or 24,776 pounds of turkey.

Table 33 - Total Maximum Capacity and Averages
by Groups on the Basis of Pounds of Dressed
Weight Per 8-Hour Day.

Market Class of Poultry	Processing Plants						All Establishments Capacity	
	Producers and Dealer		Plants Not Having Conveyor System		Plants Having Con- veyor System			
	Total Capacity	Average of Three Facilities	Total Capacity	Average of Three Facilities	Total Capacity	Average of Six Facilities

Broilers	3,079	1,026	12,803	4,268	118,500	19,750	134,373	
Fowl	3,823	1,274	22,916	7,639	280,495	46,749	307,234	
Turkeys	2,373	1,187*	11,110	3,703	234,273	46,835**	247,756	
							24,776	

* Only two in this group dressed turkeys

** Only five in this group dressed turkeys.

Table 34 gives the total maximum, present, and minimum capacity in terms of dressed weight per 8-hour day for twelve facilities on which data were obtained. Minimum capacity was determined from the per cent of maximum capacity which had to be utilized in order not to lose money on operations. Considerable elasticity in operations is shown from the fact that at minimum capacity the facilities handled only an average of 103,405 pounds dressed weight of poultry per 8-hour day, while at present capacity they handle 117,193 pounds of poultry and at maximum capacity could handle 229,791 pounds of poultry per 8-hour day.

Table 34 - Capacity: Total Maximum, Present and Minimum for 12 Facilities in Terms of Pounds Dressed Weight per 8-Hour day.

Market Class	Minimum Capacity 45% of Total Pounds	Present Capacity 51% of Total Pounds	Total Maximum Capacity Pounds
Broilers	60,467	68,530	134,373
Fowl	138,259	156,694	307,243
Turkeys	111,490	126,356	247,756
Average	103,405	117,194	229,791

Table 35 shows the total number of chickens and turkeys raised in five counties in 1946 (estimated by the average yearly increase shown in the census figures between 1939 and 1944)

and total maximum capacity of the twelve facilities on which capacity data were obtained in the five counties of the Valley. The estimated production in pounds live weight in 1946 for chickens was obtained by multiplying the number of head by the average weight of broilers and fowl. The estimated production in pounds live weight of turkeys in 1946 was obtained by multiplying the number of head by an average weight of 15 pounds per head. The estimated dressed weight produced in 1946 for both chickens and turkeys was obtained by applying a 10 per cent shrink to the live weight.

According to the data presented in Table 35, twelve facilities studied could dress all the chickens raised in the five counties of the Valley of Virginia in 196 days and all the turkeys raised in 22 days.

These figures are somewhat misleading, however, because not all chickens raised are sold but some are kept by the producers for replacements in the laying and breeding flocks. Some turkeys are kept also for replacements in the breeding flocks. In addition to this not all the poultry sold in the Valley is sold to the marketing facilities in the Valley. The Monthly Review of Financial and Business Conditions, published by the Federal Reserve Bank of Richmond, has this to say:

"With regard to marketing chickens in the area (Rockingham County) the contract feeder normally sells about $\frac{1}{2}$ to individual buyers (truckers) who can make the overnight haul of live poultry to the eastern

Table 35 - Total Number of Chickens and Turkeys
Raised in Five Counties and the Total Maximum
Capacity of the Marketing Facilities Studied
for the Year 1946.

Poultry	Number Raised		Average Yearly Increase		Estimated Production in 1946		Total Maximum Plant Capacity per 8-Hour Day		Number of Days Operation	
	as Reported by the Census	1944 Number	Number	Number	Live Weight	Dressed Weight 10% Shrink	Dressed Pounds	Pounds		
Chickens	5,437,728	10,136,652	939,785	12,016,222	46,064,888	43,258,399	220,804	196		
Turkeys	322,668	387,004	12,867	412,738	6,191,070	5,571,963	247,756	22		

terminal markets, and the other $\frac{1}{2}$ to dressing plants within the area."

Since these twelve facilities studied are not the only processing facilities in the Valley, and since they not only draw poultry from the five counties of the Valley but six additional counties in Virginia (Figure 17) as well as two counties in West Virginia, it would appear that the marketing facilities of the Valley are more than adequate to handle all the poultry produced in the five counties of the Valley of Virginia and the normal nearby area of supply.

Performance Per Worker

Table 36 shows the performance per worker by groups for the twelve poultry marketing facilities in the Valley of Virginia. The performance per worker is calculated on the basis of pounds dressed weight produced per eight hour day at present capacity which is 51 per cent of maximum capacity. The advantages of having a well organized processing facility are apparent in the Table. For instance, workers in the producers and dealer group dressed an average of 148 pounds of poultry per worker in an 8-hour day, while workers in the processing plants not having conveyor systems dressed 266 pounds per day and workers in plants having conveyor systems dressed 287 pounds of poultry per 8-hour day. In terms of percentages the workers in the processing plants without conveyor systems dressed 80 per cent more per worker than did the

workers in the producers and dealer group, and workers in plants having conveyor systems dressed 94 per cent more per worker in an 8-hour day than did the workers in the producers and dealer group.

Poul	650	163	3,896	330	23,842	355	13,058	353	
Turkeys	605	151	1,689	189	23,896	357	12,636	346	
Average All Classes	593	148	2,654	266	19,270	287	10,600	288	

Cost of Processing

Considerable variation was found in processing cost in the facilities studied. They varied from 0.8 of a cent per pound dressed weight reported by a producer to 7.5 cents per pound reported by one of the large processing plants. Table 37 shows a break-down of the cost of some of the large processing plants. The total cost per pound dressed for the low cost plants was 3.55 cents per pound while the high cost plants averaged 7.18 cents per pound dressed. The average of the high cost plants and the low cost plants gave a total average cost of 5.36 cents per pound dressed weight for dressing all classes of poultry.

Table 38 shows the performance per worker in the high cost and low cost plants in the Valley. It is interesting to note that the low cost plants dressed an average of 324 pounds of poultry per worker per eight hour day, while the high cost plants dressed an average of only 233 pounds of poultry per worker per 8-hour day. Thus, the low cost plants were dressing 41 pounds of poultry more per worker in an 8-hour day than were the high cost plants. There seems to be some room for improvement in labor efficiency in the high cost plants. Also the high cost

Table 37 - Average Cost of Processing Poultry
Per Pound Dressed Weight Reported by Fa-
cilities in the Valley.

Costs	Low Cost	High	Average
	Plants	Cost	
	Cents	Cents	Cents

Freight	.75	1.51	1.13
Total	3.55	7.18	5.36

Table 38 - Performance Per Worker in the Low
and High Cost Plants in the Valley of Vir-
ginia in terms of pounds Dressed Weight per
8-Hour Day per Worker.

Market Class	Low Cost Plants, 66 workers per Plant			High Cost Plants, 69 workers per Plant		
	Present Capacity Per Plant	Pounds	Present Capacity Per Plant	Pounds	Pounds	Pounds
		Dressed Per Worker		Dressed Per Worker		
	Pounds	Pounds	Pounds	Pounds	Pounds	Pounds
Broilers	14,471	219	14,025	203		
Fowl	24,118	365	23,289	336		
Turkeys	25,546	287	21,420	310		
Average All Classes	21,378	324	19,638	283		

plants had an average of 375 square feet of floor space per worker, while the low cost plants had 335 square feet of floor space per worker. According to this fact, the high cost plants had 45 square feet of floor space more per worker than did the low cost plants. There might be some room for improvement along this line.

Grading

All the large plants employed a special grader to grade their poultry. Standard U. S. Grades were used in all plants where grading was done. Specifications for U. S. Standards for grades for dressed broilers, fryers and roasters are given in Table 39. Specifications for U. S. Standards for grades for dressed fowl or stewing chickens are given in Table 40. In general, U. S. Grade AA refers to commercially perfect specimens of any class, U. S. Grade A refers to the second highest grade of dressed chickens, U. S. Grade B refers to the third highest grade of dressed chickens, and U. S. Grade C refers to edible dressed chickens below the grade of U. S. Grade B, except such as are specifically excluded by the general grading requirements or by the detailed specifications for U. S. Grade C.

Packing

There were wide variations in the type of containers used for packing poultry by the marketing facilities studied in the

Table 39 - Specifications for Tentative U. S. Standards for Grades for Dressed Broilers, Fryers, and Roasters

U.S. Grades	Quality Specifications for Individual Birds
U.S. Grade AA	<p>Young soft meated bird, full fleshed, well bled, well dressed and free of pinfeathers. No flesh or skin bruises allowed and only slight skin abrasions or discolorations permitted, none of which shall be on the breast. Crooked breast or other deformities not allowed. A broken or disjointed wing above the wing tip or a broken or disjointed leg not permitted. No torn skin permitted whether sewn or not. The crop must be empty and clean. Must be dry picked or semi-scalded and dry packed.</p>
U.S. Grade A	<p>Young soft meated bird, well fleshed, well bled, well dressed, and practically free of pinfeathers. No flesh bruises except very slight on back or wings and only very slight skin bruises, abrasions or discolorations permitted, none of which shall be on the breast. Crooked breasts or other deformities not allowed. One broken wing above the wing tip permitted in broilers and fryers, if the bone does not protrude through the flesh and if there is no appreciable bruise or blood clot. Broken legs not permitted except that the shanks may be broken. Slight sewn tears permitted on the back and wings, but no sewn tears permitted on the breast or fleshy part of the carcass. Open tears not permitted. The crop must be empty and clean but an entire crop completely and properly removed through a small incision at the back or side of the neck permitted. Must be dry picked or semi-scalded.</p>
U.S. Grade B	<p>Young soft meated bird, fairly well fleshed. Must be fairly well dressed and fairly well bled. May show a few scattered pinfeathers over the entire carcass. Slight flesh or skin bruises, abrasions or discolorations permitted, but not more than three such defects, if on the breast. Abrasions over two inches in diameter not permitted and tears over two inches in diameter not allowed unless properly sewn. Bent or slightly crooked breast bone or other slight deformities permitted. One broken wing or one broken leg in the flesh permitted, if bone does not protrude through the flesh and if not showing excessive bruise or blood clot. The crop must be empty and clean, but an entire crop completely and properly removed permitted</p>
U.S. Grade C	<p>Young bird, poorly fleshed. May show evidence of poor bleeding and have numerous pinfeathers over the entire carcass. Abrasions and discolorations permitted. Hunchback or other deformities allowed, if bird is fairly well fleshed. Bird badly bruised, so as to make an appreciable part of the carcass inedible, or bird showing evidence of disease or other condition that renders it unwholesome for human food not permitted.</p>

Valley of Virginia. They varied from old orange crates used by producers to a special hotel pack put up by one of the large processing plants. One producer used galvanized cans in which he packed and iced his poultry then delivered it and reused the cans.

Table 41 gives the quantity packed in different containers by the facilities studied on a percentage basis. Barrels ranked first, with 55 per cent of the quantity packed; boxes, second, with 38 per cent; consumer size packages, third, with 4 per cent; and miscellaneous, fourth, with 3 per cent. Barrels seem to be the most popular package with the poultry processing facilities studied in the Valley of Virginia.

Table 41 - Type of Packages Used and the Quantity Packed in Each by the Facilities in the Valley.

Packages	Volume Packed Per Cent
Barrels	55
Boxes	38
Consumer Size	4
Miscellaneous	3
Total	100

D. Sales.

Market Channels Utilized

The market channels utilized by the facilities in the Valley of Virginia are shown in Table 42. The producers and smaller plants tended to sell to local hotels, restaurants and retail stores in the area. The larger plants tended to sell to wholesalers and wholesale distributors located along the eastern seaboard including such markets as New York, Philadelphia, Washington and Norfolk. Market channels utilized as shown in Table 42 and the extent to which they were utilized on a per cent of volume of sales basis were as follows: wholesalers, 24 per cent; hotels, 20 per cent; wholesale distributors, 17 per cent; restaurants, 13 per cent; retail stores, 7 per cent; retail routes, 2 per cent; and other channels, 17 per cent.

Table 42 - Market Channels Utilized by the Facilities Studied and quantity Taken by Each.

Market Channels	Per Cent Taken
Wholesalers	24
Hotels	20
Wholesale Distributors	17
Restaurants	13
Retail Stores	7
Retail Routes	2
Others	17
Total	100

Some idea of the magnitude of the quantity of sales of dressed poultry may be obtained from the fact that seven of the facilities, for which data were available, sold a total of 21,401,725 pounds of dressed poultry or an average of 3,057,389 pounds per plant in the year 1946.

Prices Received by Facilities

Average prices received per pound for various market classes of poultry by the marketing facilities studied are shown in Table 43.

Table 43 - Average Prices Received per Pound
for Poultry by the Marketing Facilities
Studied for the Year 1946.

Market Class	Dressed	Dressed and Drawn	Average of Dressed and Dressed and Drawn
	Cents	Cents	Cents

Roasters	41.5	60.0	50.8
Cocks	24.0	42.2	33.1
Fowl	36.0	55.0	45.5
Turkey - Hens	41.7	55.0	48.4
Turkey - Toms	30.8	55.0	42.9

Shipping

Table 44 gives the facilities used to ship poultry by the poultry marketing establishments visited in the Valley of Virginia for the year 1946. The facilities used ~~in~~ rank in importance of per cent of quantity carried were as follows: trucks of the establishment, 71 per cent; private trucking agencies, 18 per cent; railroads, 10 per cent; and motor trucks of customer, 1 per cent. The table indicates that 90 per cent of the poultry shipped by the marketing facilities of the Valley of Virginia was shipped by motor truck.

Table 44 - Facilities Used to Ship Poultry and Extent of Use by Marketing Establishments in the Valley.

Facilities Used	Volume Shipped Per Cent
Trucks of Establishments	71
Private Trucking Agencies	18

Total	100

SUMMARY AND CONCLUSIONS

1. The increase in chicken production over the period 1910-1945 in the United States has compared favorably with the increase in production of livestock which compete with it for the farmers time and feed as well as for a place on the table of the consumer. Turkey production has increased 252 per cent in the United States over the period 1929-1945.
2. Chicken and turkey production has increased more in Virginia than cattle, hogs, and sheep.
3. During the period 1925-1945 chicken production in Virginia has had a greater increase than that of the country as a whole.
4. Commercial broiler production in Virginia has increased faster than commercial broiler production in the United States. Virginia production in 1945 was 1,251 per cent greater than in 1934 while for the country as a whole the 1945 production was only 817 per cent greater.
5. Turkey production in Virginia has not kept pace with the United States production. In 1945 the United States produced 252 per cent more than in 1929 while Virginia produced only 173 per cent more.
6. The production of chickens in the Valley of Virginia has increased to a greater extent than has the production in either the United States or Virginia. In 1944 the Valley produced 695 per cent more than in 1919 while Virginia produced 141 per cent more and the United States produced only 86 per cent more.

7. Turkey production has had a greater increase in the Valley than in either the United States or Virginia. In 1944 the Valley produced 463 per cent more than in 1929.
8. In 1944 the five counties in the Valley of Virginia produced 30 per cent of the chickens and 51 per cent of the turkeys raised in Virginia.
9. Rockingham County is the largest producer of poultry in the Valley of Virginia. In 1944, it produced 58 per cent of the chickens and 67 per cent of the turkeys raised in the Valley. In this same year Rockingham county produced 17 per cent of the chickens and 34 per cent of the turkeys raised in Virginia.
10. Farm prices per pound live weight received for chickens by Virginia farmers have tended to be higher than farm prices received by farmers in the United States. Over the period 1929-1945 Virginia farm prices averaged 2.6 cents more per pound than United States farm prices for chickens.
11. Virginia farm prices per pound live weight received for turkeys for the period 1938-1946 have averaged 2.7 cents per pound more than farm prices for turkeys in the United States.
12. Live poultry receipts in three markets have been steadily falling off while dressed receipts have been increasing over the period 1930-1945. This has been due in part to a change in consumer demand and a shift in processing facilities from areas of consumption to areas of production. In 1945 the live receipts in three markets were 52 per cent of the 1930 live receipts while the dressed receipts were 153 per cent of the 1930 dressed receipts.

13. Average monthly cold-storage holdings of dressed poultry per year over the period 1921-1941 have increased.
14. The trend in the consumption of chickens over the period 1910-1945 is similar to the consumption of all other meats. Turkey consumption has increased greatly over the period 1929-1945. In 1945 the per capita consumption of turkeys was 145 per cent more than the 1929 consumption.
15. Although the poultry industry has grown considerably in the Valley of Virginia, the facilities studied were only operating at an average of 51 per cent of their maximum capacity per 8-hour day. Furthermore, the facilities were operating on an average of 4 days per week. On the basis of a 40-hour week they were only operating at 41 per cent of their maximum capacity.

The facilities studied could dress all the chickens raised in the Valley in 196 days and all the turkeys in 22 days on an 8-hour day basis. However, it is highly improbable that these facilities would have to do this since some of the chickens raised would be kept for layers and breeders and some of the turkeys raised would be kept for breeders and many would be marketed live.

The facilities studied, in addition to serving the five counties in the Valley, also served six other counties in Virginia and two in West Virginia.

Not all the poultry sold in the Valley is sold to the processing plants but in normal times much is sold to truckers who

take it overnight to live poultry markets on the eastern seaboard.

In the light of the above facts, it must be concluded that not only are the present poultry marketing facilities in the Valley of Virginia entirely adequate but these facilities may be considered as being more than adequate under existing conditions and for some years to come.

APPENDIX A

Table 1 - Production in Pounds Live Weight and Value
of Cattle, Hogs and Chickens Produced on Farms in
the United States, 1910-1945.

Year	Cattle		Hogs		Chickens

* Not Available

Source: Computed from Table 28.

APPENDIX B
(Continued)

e. How much of an increase in volume would be required to make it profitable to enlarge the present establishment? _____

f. What is the smallest volume the establishment could operate at and not incur losses? _____

II. Purchases.

1. Total lbs. purchases in 1946 and cost. lb. _____ \$ _____

2. Source of supply

a. Counties _____

b. Localities _____

3. Average prices per pound live weight at plant paid for:

a. Broilers _____

b. Roasters _____

c. Capons _____

d. Cocks _____

e. Fowl _____

f. Turkeys _____

(1) Hens _____

(2) Toms _____

4. Seasonality.

a. In what months do you receive the largest number of:

(1) Chickens (list months) _____ % rec.

(2) Turkeys (list months) _____ % rec.

(3) Highest month:

(a) Chickens (list month) _____ % rec.

(b) Turkeys (list month) _____ % rec.

b. In what months do you receive the smallest number of:

(1) Chickens (list months) _____ % rec.

APPENDIX B
(Continued)

(2) Turkeys (list months) _____ % rec.

c. Is establishment closed during the year? If so, list months closed _____

III. Processing Capacity and Cost of Processing.

1. Finishing.

a. Cost of feed in relation to value of weight gained

b. Range in time used to finish birds _____ days

2. Present capacity (lbs. dressed birds)

a. Total capacity of establishment _____ lbs.

b. Per cent of total capacity now utilized (8-hours=100%)

3. Processing speed and cost of processing

	Processing Speed Birds per Hour			Cost of Processing per lb.		
	Dressed	Dressed and Drawn	Cut Up	Dressed	Dressed and Drawn	Cut Up
Broilers						
Fowl						
Turkeys						

4. Grading

a. Who does the grading? _____

b. What U. S. Grades are used? _____

5. Packing (on percentage basis) and cost of package

a. Boxes _____ \$ _____ %

b. Barrels _____ \$ _____ %

c. Consumer size _____ \$ _____ %

d. Cost of ice per lb. packed _____ \$ _____ %

APPENDIX B
(Continued)

6. Storage

a. Average cost per lb. for storage _____

b. Average length of time held _____ months

IV Sales

1. Total lbs. sold dressed in 1946 and returns (lbs. _____ \$ _____)

2. Market channels (including percentage and location)

a. Brokers _____

(1) Wholesalers _____

(2) Restaurants _____

(3) Hotels _____

(4) Others _____

b. Direct cooperative distribution _____

c. Other _____

3. Average prices received in 1946 per pound dressed for:

a. Broilers _____

b. Roasters _____

c. Capons _____

d. Cocks _____

e. Fowl _____

f. Turkeys _____

(1) Hens _____

(2) Toms _____

4. Transportation - shipping (on percentage basis) & (transportation costs)

a. Trucks (cost per lb. transported)

(1) Trucks of establishment _____ \$ _____ %

APPENDIX B
(Continued)

- (2) Trucks of customer _____ \$ _____ %
- (3) Employ private trucking agency _____ \$ _____ %
- b. Rail (cost per lb. transported) _____ \$ _____ %
