Outline

Topics to be discussed:

1. Project Recap
2. Work Completed
 - a. Project Timeline
 - b. Topic Analysis
 - c. Deliverable: Poster
3. Conclusions
4. Lessons Learned
5. Future Work
6. Acknowledgments
7. References

Project Recap

- Overall Goal: Identify patterns in behavior during and following natural disasters
 - Organize this data with graphs and maps
 - Communicate data to researchers
- Gather data from social media, specifically Twitter
- Our research specific to recent Puerto Rico earthquakes and Hurricane Maria

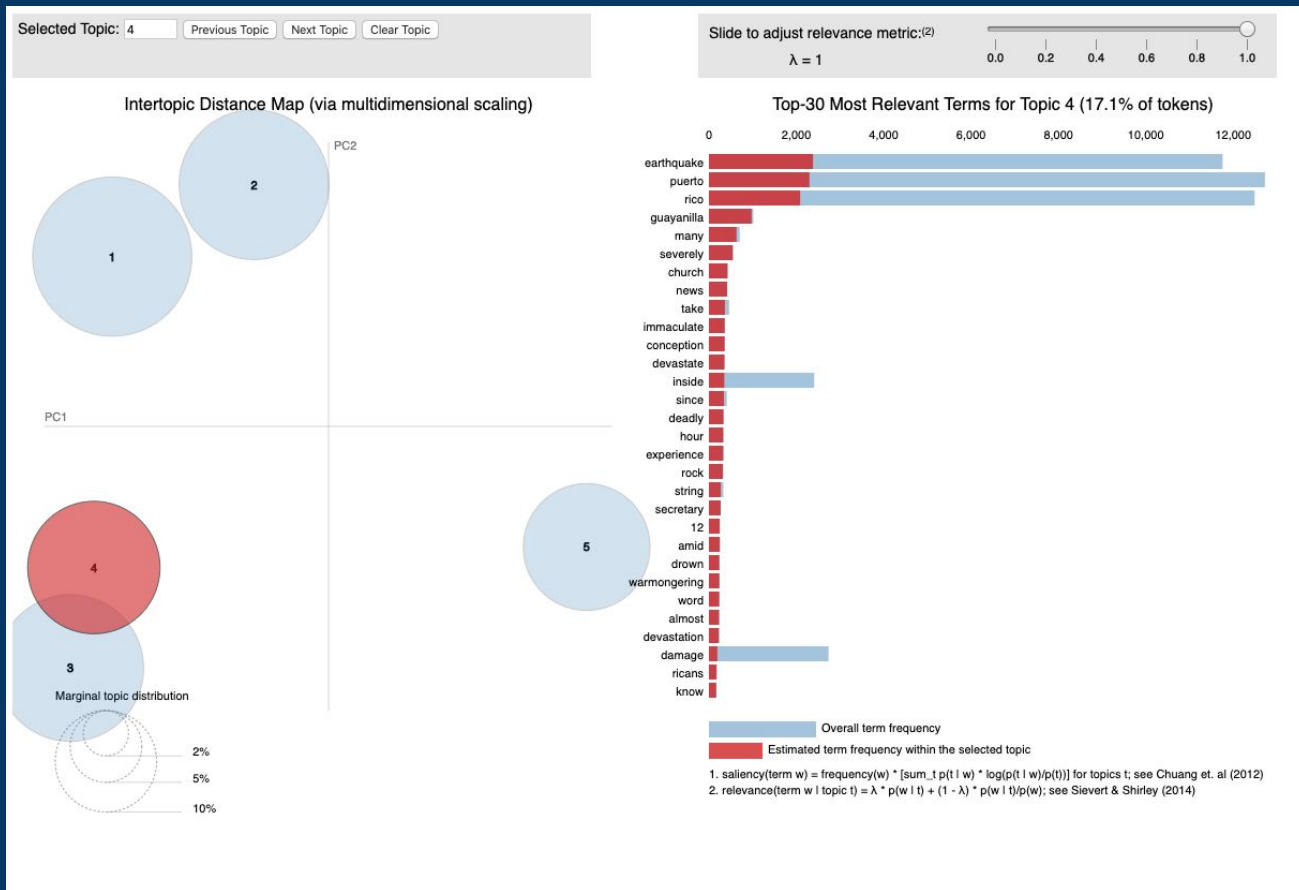

Project Timeline

Date	Description
January 29, 2020	Began word frequency analysis on an initial, smaller set of data
February 4, 2020	Created smaller dataset of tweets containing geotags
March 2, 2020	Completed word frequency analysis for final datasets of earthquake and hurricane twitter data
March 4, 2020	Completed draft of ISCRAM poster
March 30, 2020	Created map of geotag location changes during and after earthquake and hurricane
April 6, 2020	Conducted topic analysis on all tweets related to earthquake
April 20, 2020	Completed analysis on topics discussed by individuals vs organizations
April 26, 2020	Initial submission to VTechWorks
April 30, 2020	Final presentation

Topic Analysis

- Identified most common topics in tweets
- Separated tweets from individuals vs. brands/companies
- Visualization identifies 3-5 topic groups for 1-word, 2-word, and multi-word topics

Selected Topic: 0 Previous Topic Next Topic Clear Topic

Slide to adjust relevance metric:(2)

$\lambda = 1$

Intertopic Distance Map (via multidimensional scaling)

Top-30 Most Salient Terms¹

Overall term frequency

Estimated term frequency within the selected topic

1. saliency(term w) = frequency(w) * [sum_t p(t | w) * log(p(t | w)/p(t)) for topics t; see Chuang et. al (2012)

2. relevance(term w | topic t) = $\lambda * p(w | t) + (1 - \lambda) * p(w | t)/p(w)$; see Sievert & Shirley (2014)

Topic Analysis - Earthquake

	Individual	Brands / Official Accounts
One Word	power, electricity, magnitude, aftershock, devastation, health	emergency, damage, deadly, response, tremor, electricity
Two Word	church guayanilla, people homeless, trump administration, worst earthquake	power plant, without power, state emergency, damage inside, public health,
Multi Word	earthquake aftershock power, thousands residents sleep car, waiting federal aid	public health emergency response, thousands people homeless, power outage effects, withhold aid

Deliverable: Poster

- Small visual updates
- Updated graphs to highlight interesting trends
 - “Prepare” didn’t make sense for an earthquake
- Submitted findings in document form to ISCRAM website
- Poster submitted along with final report to VTechWorks

Tweet Comparison for Puerto Rico Earthquake and Hurricane Maria

Kayley Bogemann, Shane Burchard, Jessie Butler, Austin Spencer, Taylor Thackaberry

Introduction

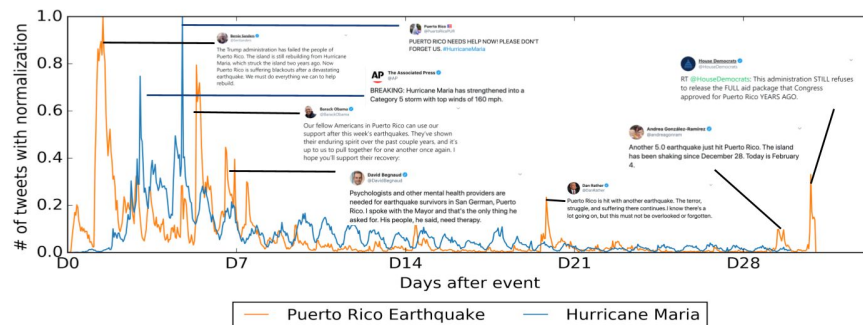

- Since December 2019, Puerto Rico experienced several **earthquakes** > 5.0 magnitude.
- By **analyzing over 300,000 tweets**, we plan to **identify behavioral patterns**.
- We consider the **geotags** associated with tweets and **key words or topics** in tweets.
- Similar analysis is run on tweets from **Hurricane Maria** to compare the behavioral patterns of tourists and locals of each event.

Methods

- Collecting Tweets** pertaining to disaster topics
- Using **Python** to analyze data using a Tweet parser
- Graphing** data, such as
 - Frequency of Tweets
 - Frequency of Topics
- Analyzing **popular topics** mentioned in Tweets

Frequency of Topics for the Puerto Rico Earthquakes and Hurricane Maria

Data

- 402,016 Tweets** related to Puerto Rico Earthquake between January 7, 2019 and February 6, 2019
- 317,214 Tweets** related to Hurricane Maria between September 15, 2017 and October 14, 2017

Conclusions

- Hurricane Maria's arrival was forecasted**, resulting in a larger corpus of tweets about it occurring the days leading up to and during the event.
- The earthquakes were not predicted**, and sporadic aftershocks meant that sharp spikes of activity started every time there was another earthquake.
- The overall decrease in discussion over the time period is **likely due to external (mainland US) lack of interest or relevance**.

Recovery for Transportation and
Power Disruptions

The above maps illustrate Hurricane Maria's path compared to a heatmap of Twitter activity

Conclusions

- Difficult to filter out irrelevant information on Twitter
- Forecasted events, such as Hurricane Maria
 - Much more data leading up to the event
 - Geolocation of tweets showed the path Hurricane Maria followed
- Unpredicted events, such as earthquakes
 - Sharp spikes of activity with the sporadic aftershocks
- Tweet activity overall decreases over the time period

The above maps illustrate Hurricane Maria's path compared to a heatmap of Twitter activity

Lessons Learned

- Importance of communication
 - GroupMe
 - Important to give updates as soon as possible
- Transition to Zoom meetings was difficult
 - Varying levels of internet quality
 - Not all team members could attend all meetings
- Creating clearer project goals and deliverables
 - Planning ahead

Future Work

- Analysis we conducted could be expanded
 - COVID-19, future natural disasters
- Storage of data into SQL Database
 - Python analysis ran slow
- Implementation of other Natural Language Processing Techniques
 - Our topic analysis used pyLDAvis.gensim, nltk
 - spaCy
 - Prepare the dataset for deep learning
