

To my parents, Barbara and Peter Heine.

To the memory of my grandfather, Erich Heine.

*because you taught me the values I treasure,
because you gave me the childhood I had,
because you gave me the life I have.*

Acknowledgements

This work drew upon the interaction and communication with many very enjoyable and fascinating individuals, some of who have become dear, treasured friends. The realization and completion of this study would not have been possible if it had not been for the financial support provided by the U.S. Department of Agriculture National Research Initiative Competitive Grants Program (Contract ID: 98-35103-6582) and the help and contribution of many persons in the Department of Wood Science and Forest Products at Virginia Tech. For their wonderful support in this endeavor, some people deserve special recognition.

It is a particular pleasure to recognize the involvement of Dr. J. Daniel Dolan, my advisor and committee chair. While his kindness and faith in me provided encouragement and trust, his guidance, and most important his friendship, gave invaluable support and inspiration in the long journey through the writing of a dissertation *and* thesis. I am especially thankful for his listening, his friendship, and his willingness to embrace, and patience to endure, my propensity to follow up on parallel interests. Thank you for being such a wonderful advisor.

The precious and instrumental exchange of German and American philosophies about science, work, recreation, and other aspects of life was possible with Dr. Joseph Loferski. Even though, to this end, we do not share the same opinion of who invented what¹, we do share a true friendship, which helped make this project very enjoyable. Endless discussions and adventurous excursions to explore the world of natural resources (and its recreational uses) increased both my knowledge of this and many other subject matters and my appreciation of his invaluable help.

Bearing in mind the gracious assistance, many important insights, and the identification of potential pitfalls, I am equally indebted to Drs. Hans Blass, Raymond Plaut, Mahendra Singh, and Frank Woeste, Motoi Yasumura and Mr. Phillip Line. Thank you for your time and expertise.

This work would be far from complete if it were not for the ‘man behind the scenes’. I cannot thank enough Guy Anderson who so diligently and enthusiastically carried out the experimental phase. Thank you for the great job you have done. This is probably a good place to apologize for the tedious test-set up I designed.

I am who I am and what I am because of my family and friends. What was most exhilarating in the last few years, was the acquaintance of captivating personalities from all over the world. My warmest thanks are extended to very special people from Canada, China, France, Germany, Hungary, Israel, Italy, Russia, Slovenia, Spain, Switzerland, Turkey, and the U.S.

¹ To throw in a new thought: perhaps neither Germans nor Americans invented all things...
