

Acknowledgments

I would like to thank Dr. Woeste, Dr. Dolan, Dr. Loferski, Dr. Cundiff and Dr. Holzer for serving as my committee members and for participating with this research project. Dr. Woeste initially suggested I explore post-frame diaphragm design procedures as a potential means of deriving design methodologies for timber frame structures. I greatly appreciated his enthusiasm and practical perspective on the work and its applications. Dr. Dolan instructed me on appropriate test methods to use, considering the equipment at our disposal, in order to meet the objectives of the project and on the interpretation of resulting test data. I am thankful for the respect and guidance he provided and also for his efforts to replace the hydraulic controller. Dr. Loferski was always there with pragmatic suggestions and helped me keep in mind the overriding material properties of wood and general mechanics that dictated the behavior of the test specimens and testing apparatus. Dr. Cundiff and Dr. Holzer were always very supportive and provided input and assistance as this project developed. The time I have spent with all my committee members over the past four years has been very rewarding, both in terms of my dissertation project and my personal development as an engineer. I thank them all for helping me with this work.

I am grateful to Dr. Perumpral and the Biological Systems Engineering Department for supplying me with the teaching assistantship in Agricultural Technology, which funded my four years of graduate school and provided me with invaluable teaching experience. I am grateful also to Dr. Cundiff for financial support he provided through the United States Department of Agriculture.

Fabrication and testing of my five test roof panel assemblies would not have been possible without the technical assistance of Rick Caudill, Kenny Albert, Harrison (Butch) Sizemore and Leon Alley. Their knowledge and skills proved to be fundamental for completing my testing in the short time I had.

For their input, donations and time I would like to thank Sandy Bennett and Al Anderson of Blue Ridge Timberwrights, John Miller of Dreaming Creek Timber Frames and Rick Sasala and Frank Baker of Great Lakes Insulspan. The materials they donated

and their knowledge about timber frames and SIPs were extremely valuable in developing my methodologies and interpreting the results of the tests.

My friends and colleagues in the Biological Systems Engineering, Civil Engineering, and Wood Science and Forest Products Departments were always supportive and helped with everything from moving timbers to video taping the tests. I am grateful that I never had to look far for a helping hand or word of encouragement.

I especially want to thank my best friend and fiancée, Bethany George. She was always there to make sure I knew I could complete this project and how valuable a person I am. I can't thank her enough for being there for me during some of the most difficult times in my life and for always stepping in to pick up the slack when I couldn't.
