8. Barikani M, Hepburn C (1987) *Cell Poly* 6, p41.
9. Differential scanning calorimetry of PTMO-*p*PDI-U indicated two convoluted endothermic peaks centered at 43 and 50°C that correspond to the melting transition of

- the *p*PDI based HS phase. The melting point of pure *p*PDI is 97°C. In addition, the 2D WAXS of PTMO-*p*PDI-U indicated a sharp azimuthally independent reflection at 4.1Å.
10. We conducted tensile tests of the sample PTMO-*p*PDI-Ur before and after compression molding. Both samples exhibited comparable Young's modulus, tensile strength, and elongation at break thereby indicating that degradation or chemical cross-linking upon remolding was limited, if any at all.
