

**Fig. 1.** Recovery of *Cylindrocladium parasiticum* from speckled peanut seed of NC-V 11 and VA 98R during winter seed storage. Seeds were assayed on a selective medium at 0, 8, 16, and 24 weeks after storage. Bars from left to right for each time interval reflect storage at  $-13$ ,  $4$ ,  $15^{\circ}\text{C}$ , and ambient temperatures in an unheated building. Bars with the same letter or no letters are not significantly different according to Duncan's new multiple range test ( $P=0.05$ ).
