

# Acknowledgments

I am tremendously thankful to many for their support and encouragement during the time that I spent on this work. Their contributions have been vital to my success in graduate school.

Foremost, my family was instrumental in providing continual love and support throughout my college career. Their care and concern were evident in the many “good luck” wishes, emails, phone calls, and “real” mail. I have to admit that receiving letters in the mail that included single sticks of gum truly reflects their uplifting support. My girlfriend, Kelsey, deserves many more thanks for her generosity and love. Her understanding made frustrating days seem less important and she inspires me to continue looking forward to a new day.

Dr. Don Leo has been very beneficial to the work that went into this thesis. His knowledge and advice has allowed me to enjoy my first taste of research. Though he was not always in the office, his trust in me to fail and succeed at my own pace made working at CIMSS a great learning experience. I look forward to working with him on my Ph.D.

In addition, my other committee members, Dr. Dan Inman and Dr. Nakhiah Goulbourne, attracted me to work in CIMSS and have treated me better than most West Virginians would expect. My colleagues at CIMSS, who have put up with my constant questions and bantering, deserve many thanks as well. Thompson Mefford and Dr. Judy Riffle in the Chemistry Department were also instrumental in helping me understand the chemistry involved with these materials and in performing thermal analysis on the resins.

I would like to acknowledge the Integrative Graduate Education and Research Traineeship (IGERT) Fellowship provided by the National Science Foundation for funding this work. The author is greatly appreciative for this support.
