

ACKNOWLEDGEMENTS

First I would like to express my sincere gratitude and thankfulness to my advisor and committee chair Dr. S. Ted Oyama for giving me the guidance and conduct during the past three years. I really appreciate his patience, encouragement, experience, and acute observations. I also thank him for his creative thinking and the expertise he shared with me that will certainly be a tremendous resource for my later work.

Also, I am deeply indebted to my other committee members: Dr. David F. Cox and Dr. Brian E. Hanson. Their suggestions and assistance played an important role in the progress of my research.

During the past three years, I have been fortunate to work with the Environmental Catalysis and Nanomaterials Laboratory in the department of chemical engineering at Virginia Tech. I would like to thank Corey Reed and Yong-kul Lee for training me in various experimental methods used in the lab and helping me to start with my research. Yong-kul gave me great help in the EXAFS and XANES measurements and data analysis. Thanks also go to all group members including Juan Jose Bravo, Dr. Yuying Shu, Dr. Yunfeng Gu, Pelin Hacarlioglu, Hankwon Lim, Jason Gardet, Haiyan Zhao, and Travis Gott for their helpful and stimulating discussions. I would also thank the staff in the chemical engineering department for their help and great work during the past years.

Last but not least I would like to thank my family for their love, patience, and encouragement over years. I would like to express my deepest love to my husband Ming Han for his support. I also would like to share my work with my coming baby who has accompanied me

during the past half year and I am expecting her in the coming August. It is my privilege to be able to dedicate this work to them.
