

Figure 1.4. 5' deletion analysis of *gp-2* promoter in *Dictyostelium discoideum*. TAG and C boxes are shown. Luciferase activity was measured after 22h of development of transformants. Deletion of the region containing upstream TAG box (32) and of downstream C box (2-7) caused 100 fold decrease in the luciferase activity. Addition of these boxes (2Aplus) increased the activity.
