The architectonic and urban intervention plan for the fishing village of Puerto Real merge the vernacular, popular and traditional lifestyle of its residents with the artistic, technological and progressive ideas of architecture. The development of the ideas for a fish market were born through the analysis of the transformation of the existing site and context, the behavior of the environment and the lifestyle and needs of the users. The humble residents and the village’s structure stimulate the design process and made it one full of sensibility and care that will bring about positive results to the resident’s standards of living.

Understanding the lifestyle of the residents of the fishing village helped in the design of the fish market in a way that will influence their culture and economics standards.

The spatial sequence and the concrete, wood, steel and fabric composition of the market interpret the vernacular architecture and the needs of the town. The spaces as well as the structure were put together to showcase the natural resources of the Puerto Real Bay with the idea of bringing back the presence of nature into the residents’ life.
