

DEDICATION

to my father

LEONARD OCTAVIUS HAYDEN

January 3, 1920-June 16, 1997

ACKNOWLEDGEMENTS

The completion of this work would not have been possible without the support and assistance of a number of people. My gratitude goes first and foremost to my advisor, Dr. Kimberly Forsten for her continued guidance, instruction, support, and encouragement, and for her ability to remain positive and energetic throughout the ups and downs of research. My gratitude also goes to Dr. R. Michael Akers for his expertise and guidance and use of his laboratory, and to Dr. Richey Davis and Dr. William Velander for the use of equipment and/or materials in their respective laboratories.

My thanks to Patricia Boyle of the Department of Dairy Science for her continued assistance in learning the technical knowledge and skills needed for the experiments using cell cultures and for making sure that I always had the supplies I needed to work; to Lucy Gray of the College of Veterinary Medicine for her assistance and many fruitful discussions in regard to use of the Cytosensor Microphysiometer System to evaluate cell responses and for seeing that I had access to lab facilities; to Julie Petruska of Civil Engineering for autoclaving supplies, even at a moment's notice, thereby facilitating research.

For the chemical engineering students who assisted me in my research I am also thankful: undergraduate Leonard Jenkins for many volunteered hours in helping develop techniques for quantifying cell counts on membranes used on the microphysiometer, undergraduate Matthew McKee for his help in taking measurements with the potentiometer across cell monolayers on membranes, and graduate student Andrew Sweeney for his help running conditioned media across a column for proteoglycan separation. To Miriam Weber and Steve Ellis, doctoral students in the Department of Dairy Science, I am grateful for helpful suggestions.

I am also grateful to the course professors and fellow students who took the time to answer my academic questions as a returning student. In particular, I am grateful to Dr. James Holub of the Mathematics Department who generously took the time and had the patience to answer my math questions, including the use of Mathematica to solve problems.

Thanks also go to Veronique Timmermans and Dr. Anna Aherne of Molecular Devices of Sunnyvale, CA for training and continued technical support on the Cytosensor Microphysiometer System.

Thanks to Sundar Dorai-Raj and Pamela Norris of the Statistical Consulting Center for their assistance and recommendations for statistical analysis of the data.

This work was supported by the Whitaker Foundation Biomedical Engineering Research Grant.

And finally, my gratitude to my family, without whose support I could not have continued my studies. I owe a debt of gratitude to my late father Leonard Hayden, a gifted research physicist and inventor who inspired me with his lifelong quest for knowledge, to my mother Johanna Hayden for teaching me the values of diligence and patience, to my brother Erich and to my sister Karin for their support, and to my husband Gary whose love and support made graduate studies possible.
