Mining and Minerals Engineering

(ABSTRACT)

Over the past 40 years, several procedures have been proposed for characterizing ideal flotation behavior. These procedures, known as release or tree analysis, generally involve multi-stage flotation in batch, laboratory flotation cells using various combinations of rougher, cleaner, and scavenger configurations. Although some of these procedures have been experimentally compared, there remains considerable controversy as to which approach best approximates the ideal flotation response. In this investigation, modeling and simulation techniques are used in conjunction with experimental studies to compare three procedures commonly used for characterizing flotation behavior. These procedures include timed release analysis, simplified release analysis, and tree analysis. Timed release analysis is shown to produce superior results to simplified release analysis and tree analysis; although simplified release analysis appears to be best suited for locating the “elbow” of the grade-recovery curve. In no case, do any of these techniques approximate a perfect separation. A novel technique, known as reverse release analysis, is described and demonstrated to be superior to the other three procedures. Finally, a theoretical methodology for obtaining the true ideal separation curve is presented.

ACKNOWLEDGMENTS

The author would like to convey his deepest thanks and appreciation to Dr. Gregory T. Adel for his friendship, guidance, and support throughout this project. He would also like to thank Dr. Gerald H. Luttrell, Dr. Roe-Hoan Yoon, and the staff of the Center for Coal and Minerals Processing for their advice and assistance during the progression of this course of study.

The author would also like to thank Cyprus Amax Coal Company and the U.S. Department of Energy for their contributions to this project which made everything possible. Deepest appreciation is extended to everyone at Plantation Road whose help and friendship will always be remembered.

Lastly, the author would like to express his deepest thanks and appreciation to his family, whose love, support, and encouragement made everything possible.
