

ACKNOWLEDGEMENTS

I am ever grateful to God, the Creator and the Guardian, and to whom I owe my very existence.

I would like to express my deep appreciation and gratitude to the following people for helping me complete this thesis.

Dr. Anbo Wang, my advisor and committee chairman, for giving me an opportunity to work in FEORC. Without his continuous support and assistance it would not have been possible to finish this dissertation.

Dr. Richard O. Claus and Dr. Russell G. May, for serving in my committee and for their valuable help from time to time.

Hai Xiao and Ming Lou, my colleagues, for their help and guidance during the course of our project.

Staff and students in FEORC, especially Linda Jones, Priya Perumalsamy, Robert Lockhart, and Jun Wang, for making my stay there comfortable and unforgettable.

Sundar G. Sankaran and Sriram Chandrasekaran, for taking time to read my thesis and offer suggestions.

My friends from College of Engineering, Guindy, and the ones in Virginia Tech for their encouragement and support especially at times when things were going tough.

My parents and my brother, to whom I dedicate my work. I am thankful for their love and best wishes, which despite of their physical absence has helped me in the successful completion of my study in Virginia Tech.

This work was completed sponsored by Virginia Center for Innovative Technology and DCS Corporation, Alexandria, VA.
