# Mathematical Modeling of Circadian Rhythms in *Drosophila melanogaster*

Christian I. Hong

## (Abstract)

Circadian rhythms are periodic physiological cycles that recur about every 24 hours, by means of which organisms integrate their physiology and behavior to the daily cycle of light and temperature imposed by the rotation of the earth. *Circadian* derives from the Latin word *circa* “about” and *dies* “day”. Circadian rhythms have three noteworthy properties. They are endogenous, that is, they persist in the absence of external cues (in an environment of constant light intensity, temperature, etc.). Secondly, they are temperature compensated, that is, the nearly 24 hour period of the endogenous oscillator is remarkably independent of ambient temperature. Finally, they are phase shifted by light. The circadian rhythm can be either advanced or delayed by applying a pulse of light in constant darkness. Consequently, the circadian rhythm will synchronize to a periodic light-dark cycle, provided the period of the driving stimulus is not too far from the period of the endogenous rhythm.

A window on the molecular mechanism of 24-hour rhythms was opened by the identification of circadian rhythm mutants and their cognate genes in *Drosophila*, *Neurospora*, and now in other organisms. Since Konopka and Benzer first discovered the *period* mutant in *Drosophila* in 1971 (Konopka and Benzer, 1971), there have been remarkable developments. Currently, the consensus opinion of molecular geneticists is that the 24-hour period arises from a negative feedback loop controlling the transcription of clock genes. However, a better understanding of this mechanism requires an approach that integrates both mathematical and molecular biology. From the recent discoveries in molecular biology and through a mathematical approach, we propose that the mechanism of circadian rhythm is based upon the combination of both negative and positive feedback.

## Dedication

I would like to dedicate this thesis to my parents, Yun Cho Hong and Jung Sook Hong, for their love and support. I love you mom and dad.

## Acknowledgement

First of all, I would like to thank God for His grace and mercy to save me with Jesus' sacrifice, and working in me in every detail of my life. You were with me for all those years and you were my comfort and peace.

I would like to express my utmost gratitude to my major advisor Dr. John Tyson for his professional guidance and direction in mathematical biology. His solid knowledge in mathematical and molecular biology were foundations of my research project. His dedication of his time and patience are greatly appreciated. I would like to thank Dr. Kenneth Hannsgen and Dr. David Popham for their helpful advice as my committee members. I appreciate their dedication and giving up their time in attending all those meetings and supporting me with tremendous encouragement. Without their direction and guidance, I would not be able to complete this project.

I would like to especially thank Dr. Kathy Chen for her wonderful help in every aspect of my life as a graduate student. Her selfless dedications of her time and effort in helping me with the completion of my research project were unbelievable. I would also like to thank the other people in the lab: Dr. Mark Borisuk who is now at California Institute of Technology, Dr. James Watmough who is now in Canada, Dr. Pavel Brazhnik, Mr. Andrea Ciliberto who is now in Italy, Ms. Laurence Calzone, and Mr. Kalimar Maia, who calculated the two parameter bifurcation diagram of  $K_{eq}$  vs.  $k_{pI}$ . I am blessed to meet and work with all these great people.

I also would like to thank my great friends in Korea Campus Crusade for Christ. You shared my joy and tears. I am blessed because I have you. I know that I would not be able to do this without your support and prayers.

Finally, I would like to thank my parents, Yun Cho Hong and Jung Sook Hong, for their love, hope, encouragement, selfless support, and prayer. Without them, I would not be here. Thanks to my brothers, Philip and Gabriel, and sister-in-laws, Mee Kyung and Sook Kyung. I love you all.
