Sacred + Profane

Liliana Gonzalez

abstract

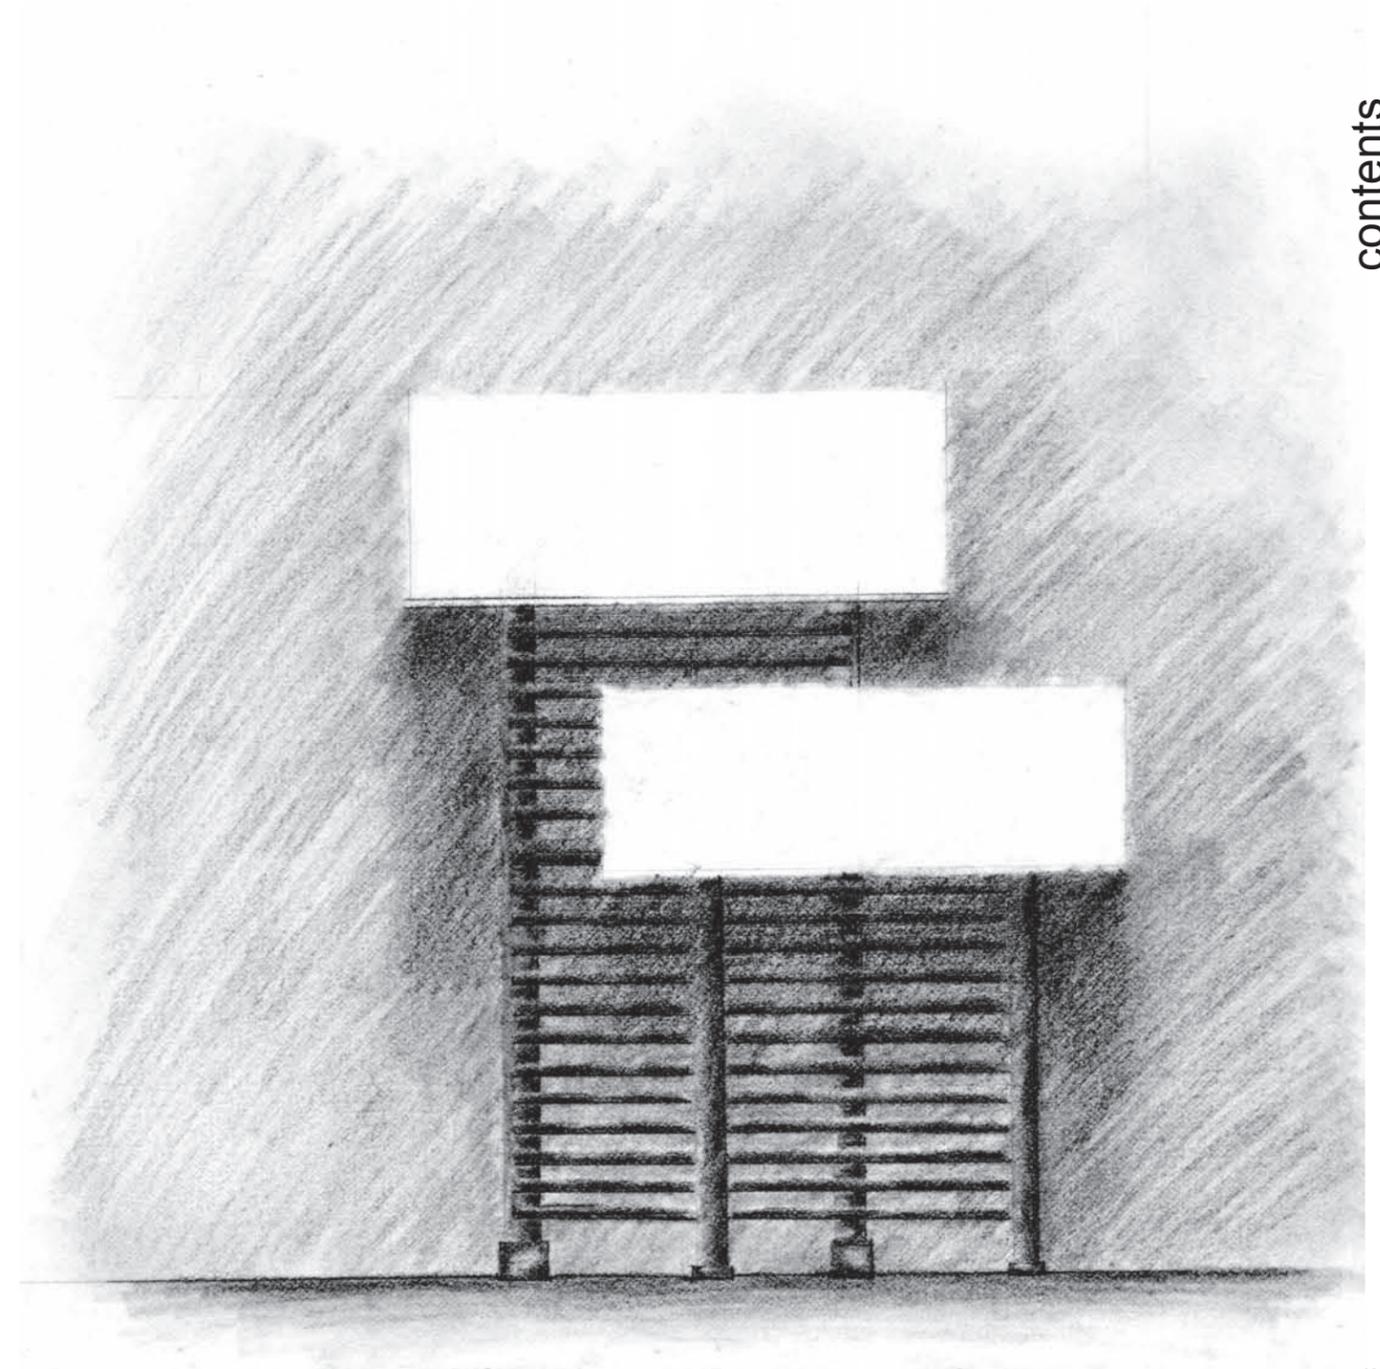

"...while bathing you may experience revelations, flashes, glints, significant connections, and transcendent understandings".

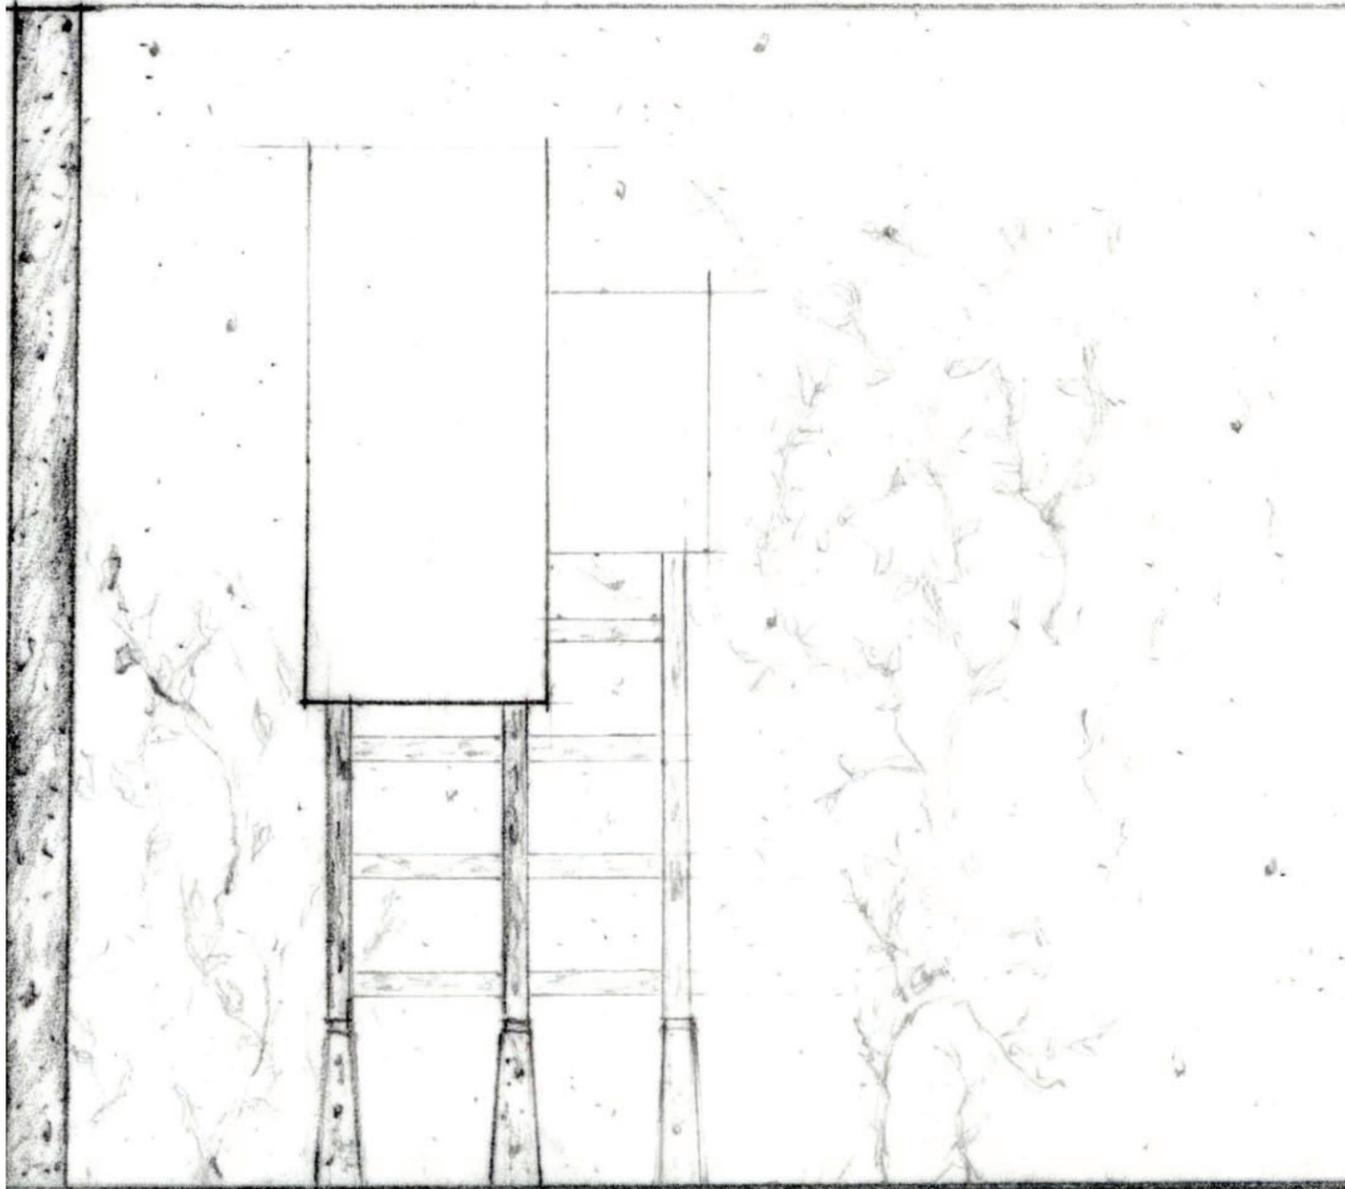

- Leonard Koren

in Iztapalapa, south of the Yuhualixqui volcano, lies an informal settlement of an estimated 2600 inhabitants. informal settlements have with them the connotation of quick, temporary, unthoughtful architecture that dissolves with the first pass of rain. in reality, most of the informal settlements that appear become permanent homes for those families. a community emerges through the rough architecture and the need for the basic necessities becomes a daily struggle. religious faith remains strong in slum communities, although water, the most essential element is missing. i attempt to address both the religious faith of the community and their need for water by providing a place where the most sacred and the profane meet.

Mexico City is home to 20 million people, a third of which live in informal settlements that lack the basic services most are accustomed to. what began as a desire to further research the slum communities and their natural development soon focused on providing those basic needs to the community: water and a place to worship. through the use of local materials, i attempt to create a deserving space for the statue of the Virgin Mary, as well as a bath house for the community.

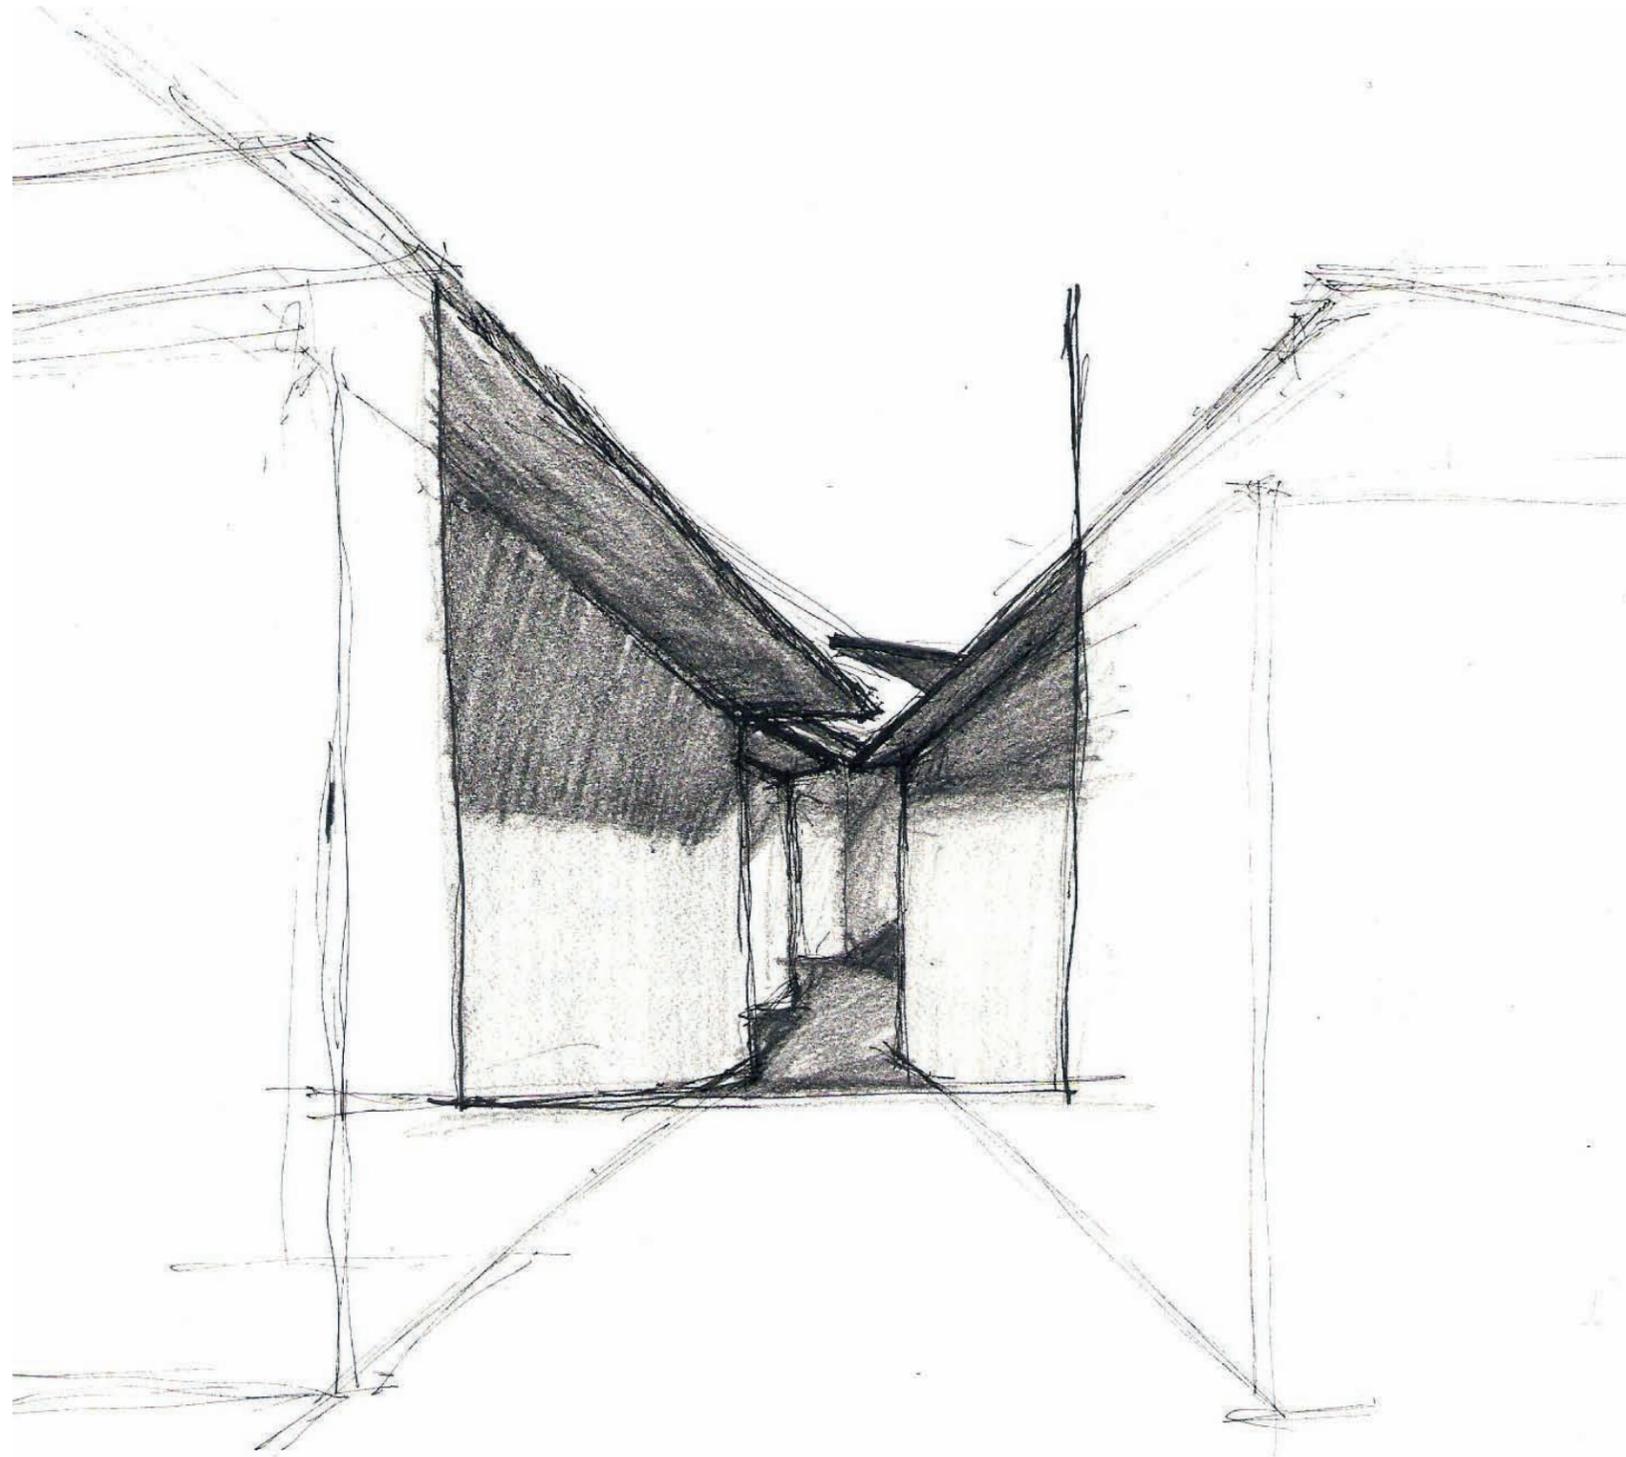

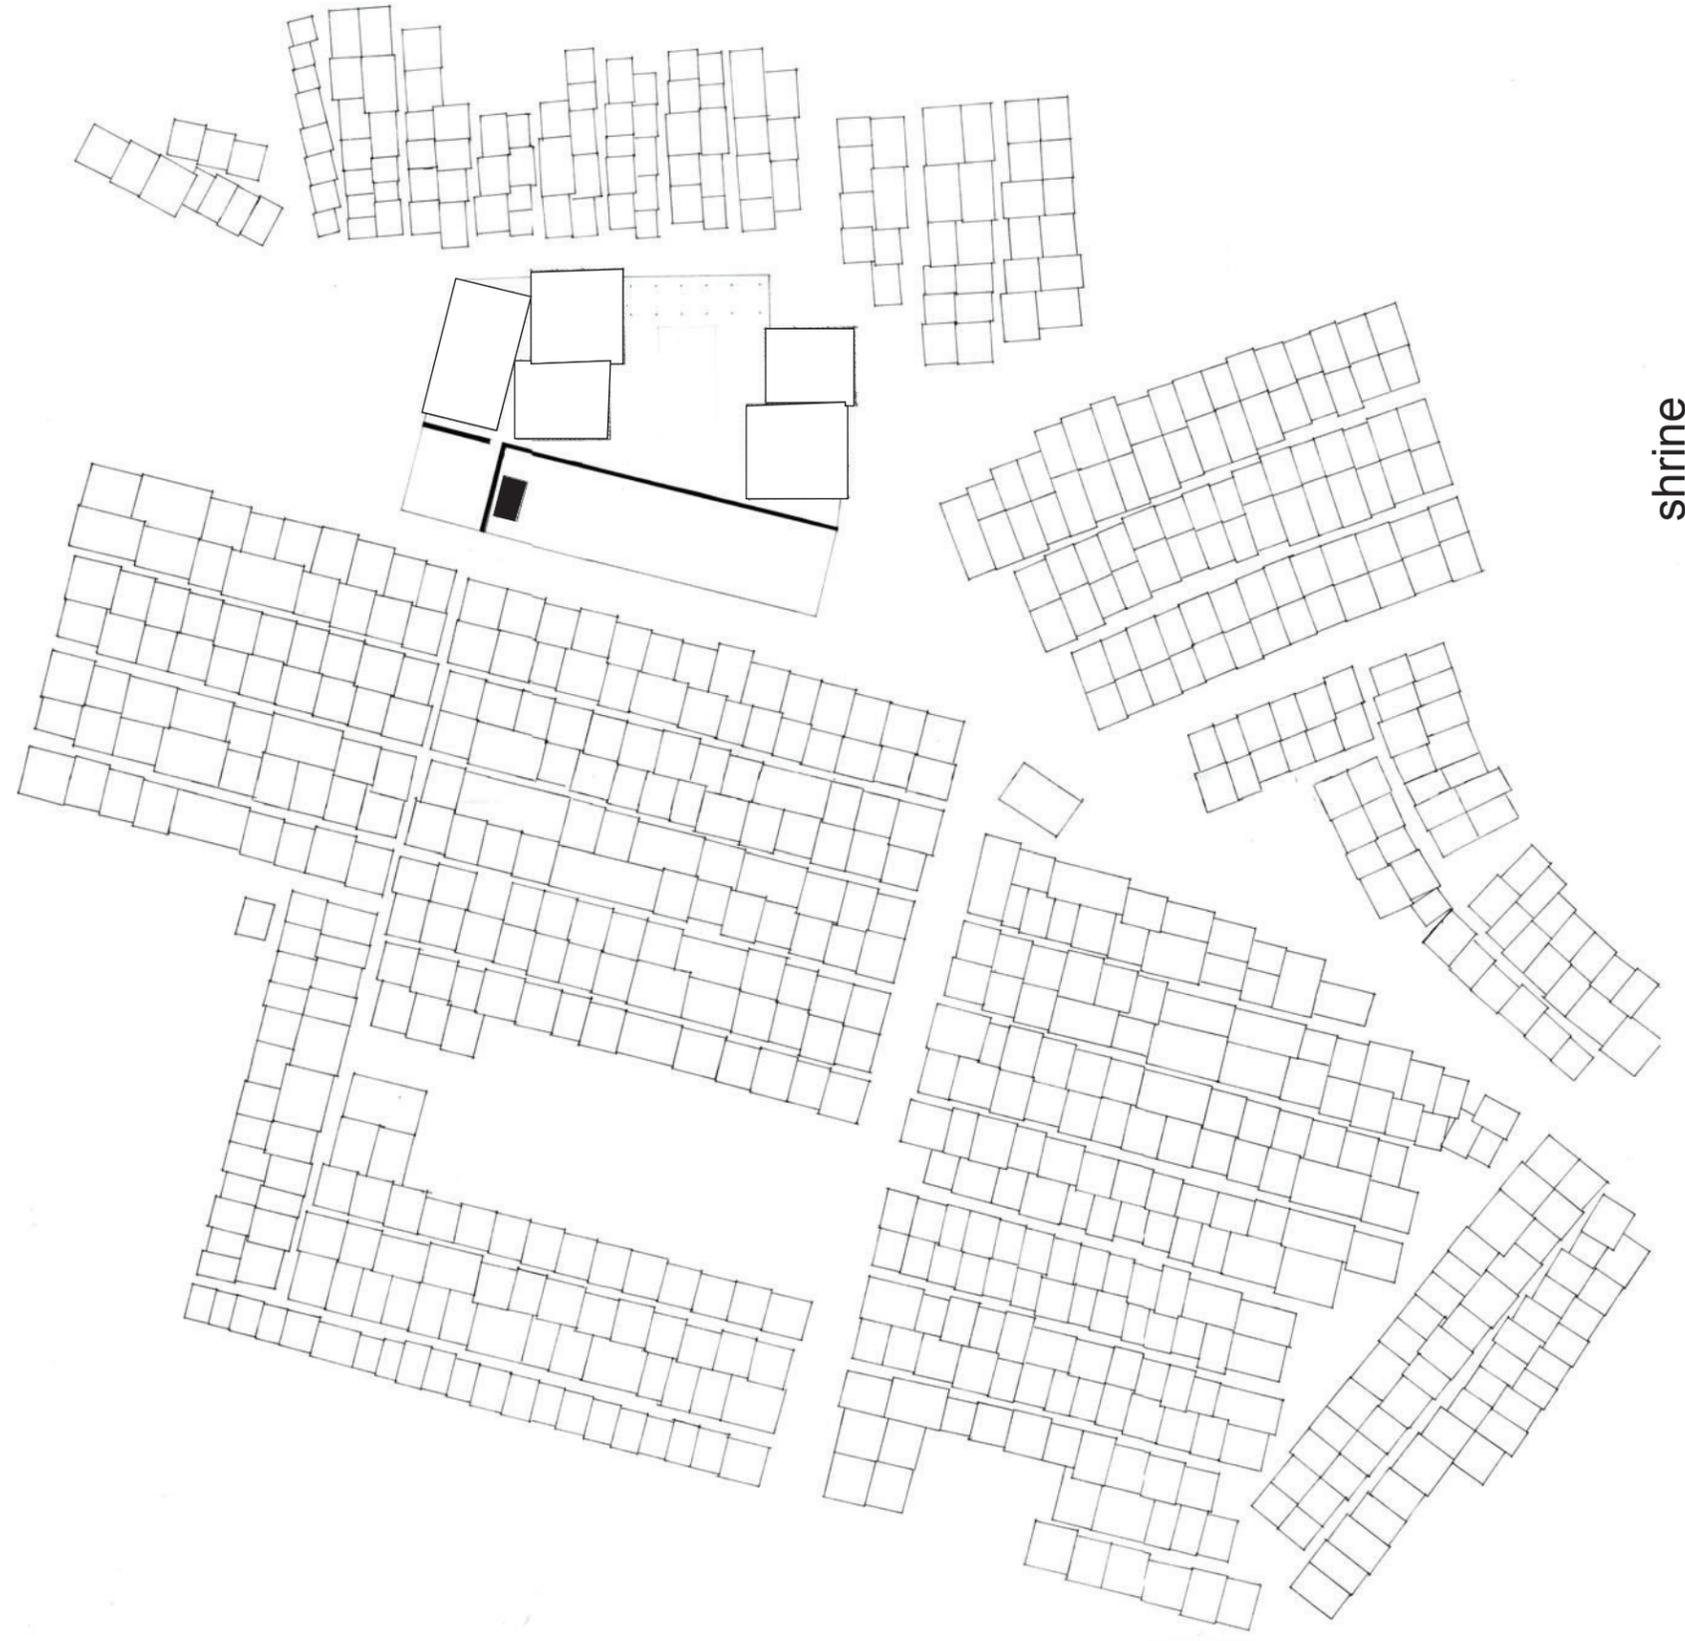

no pattern but there is a rhythm

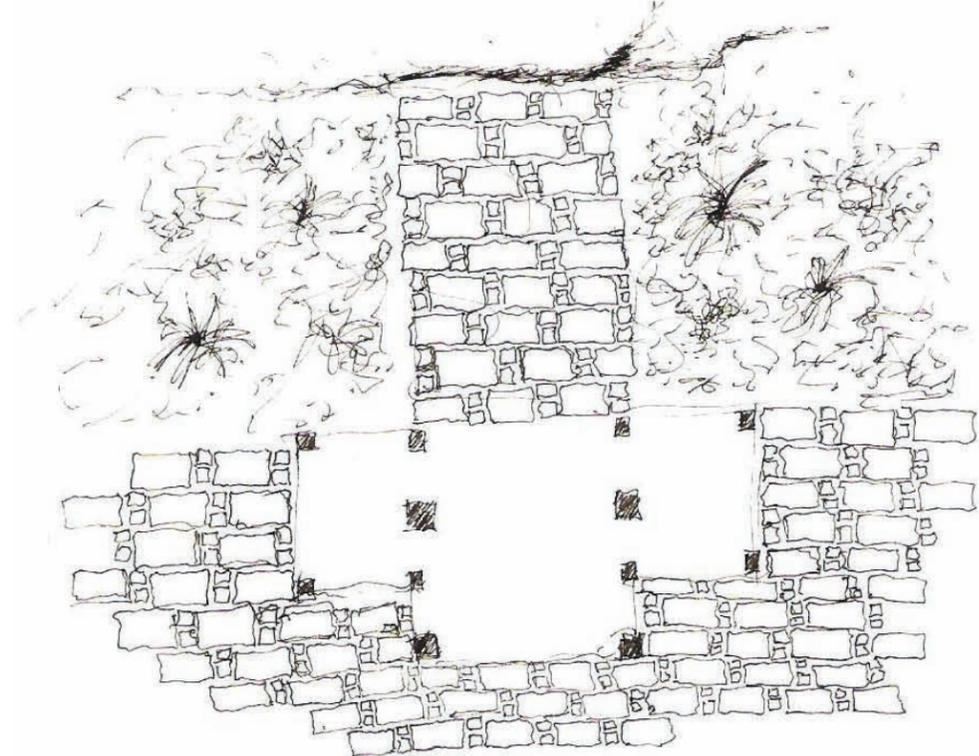

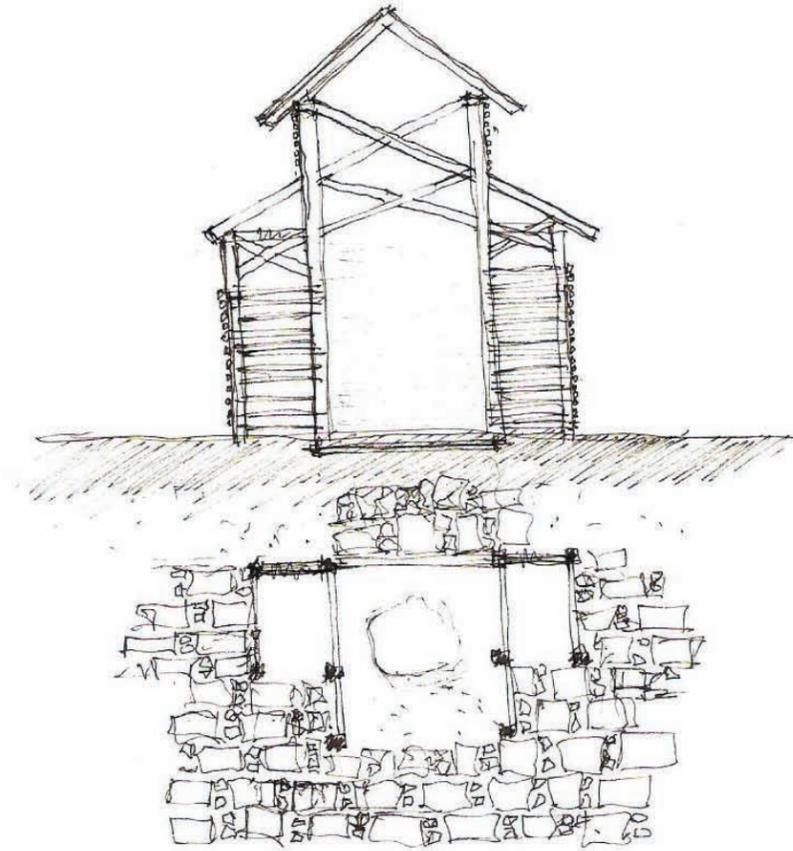

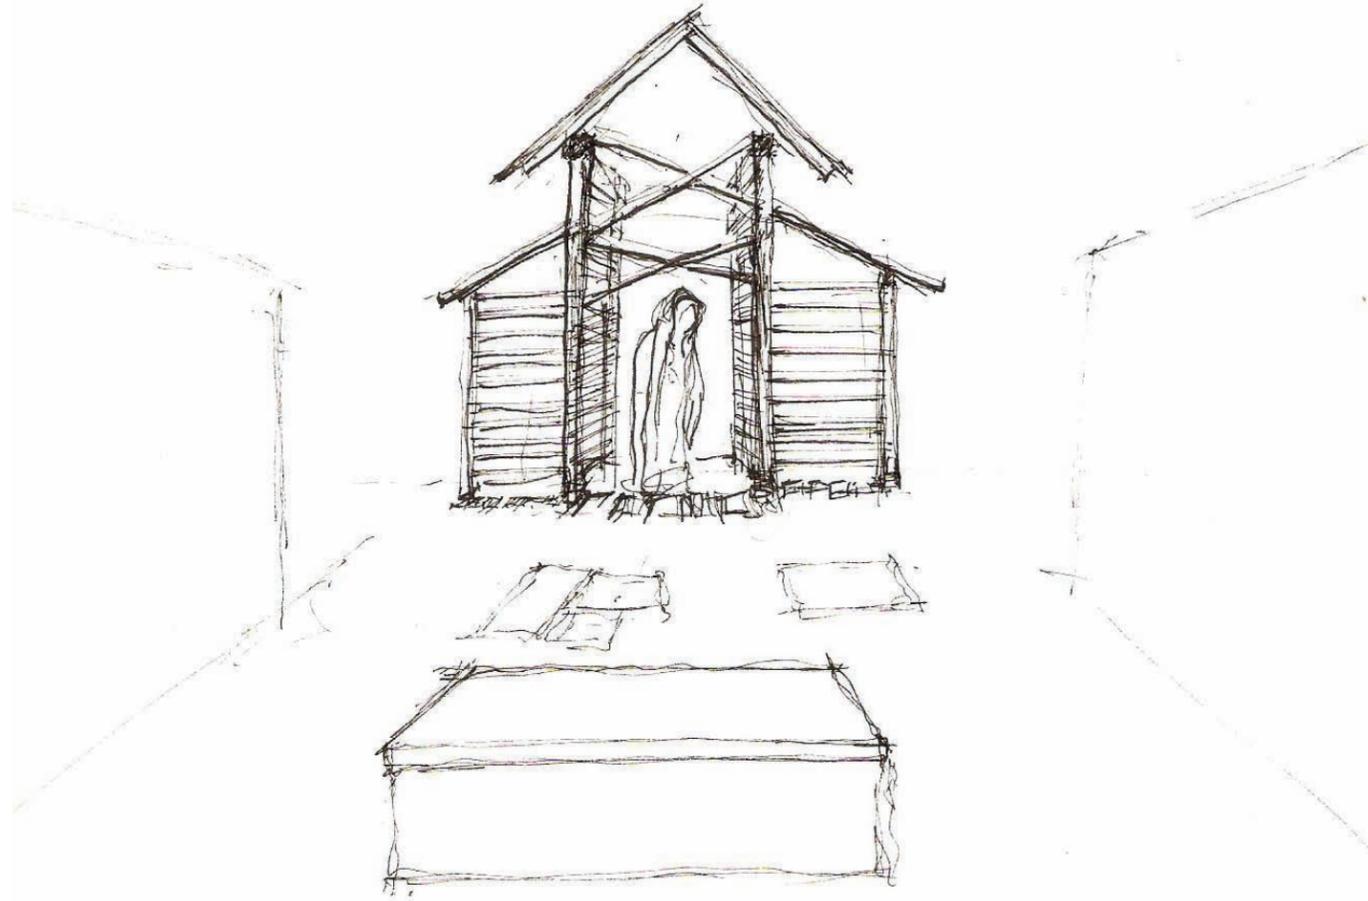

study of roof heights

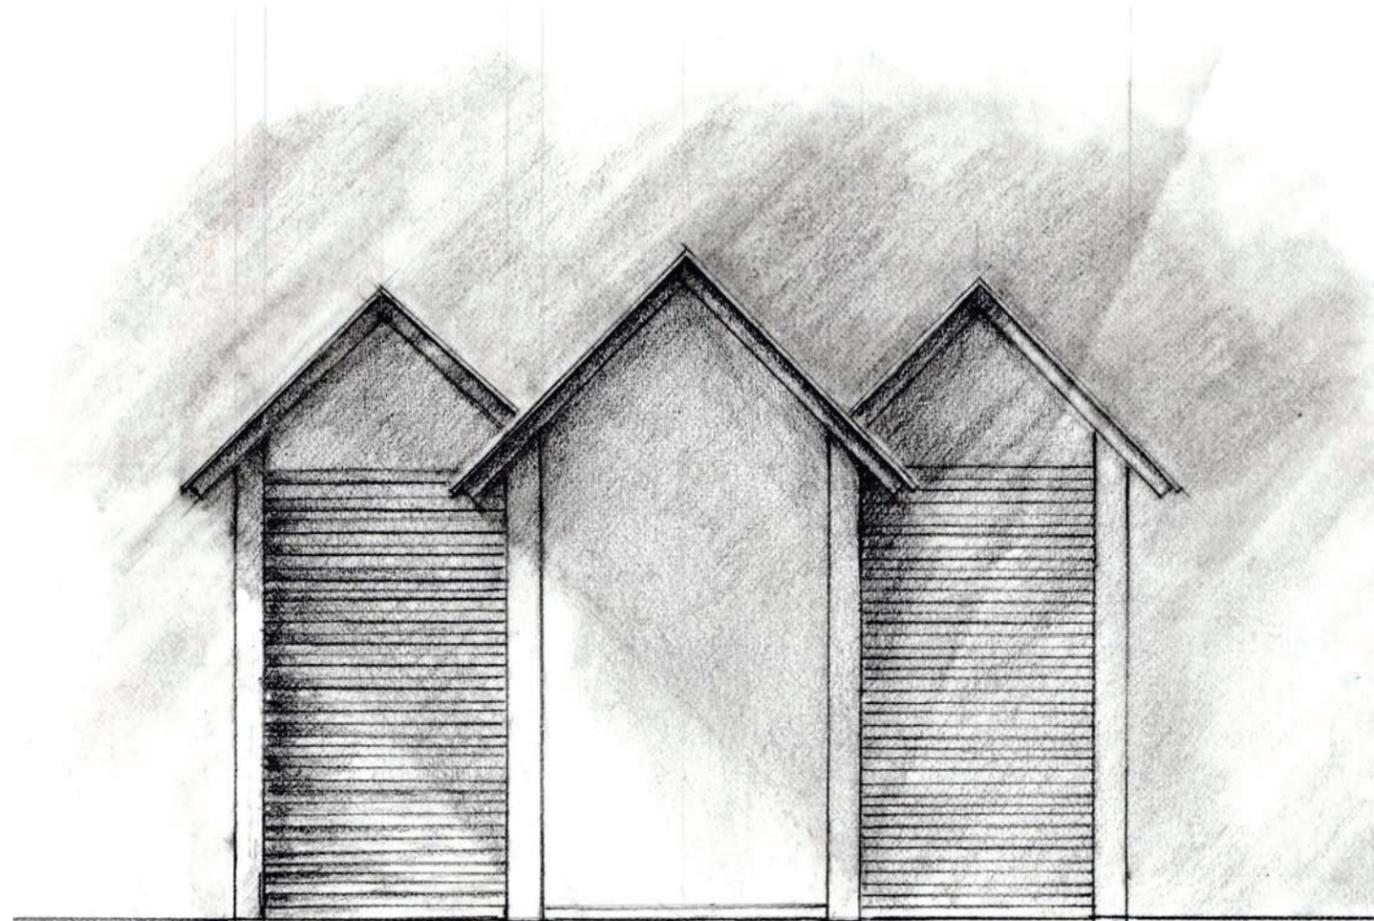

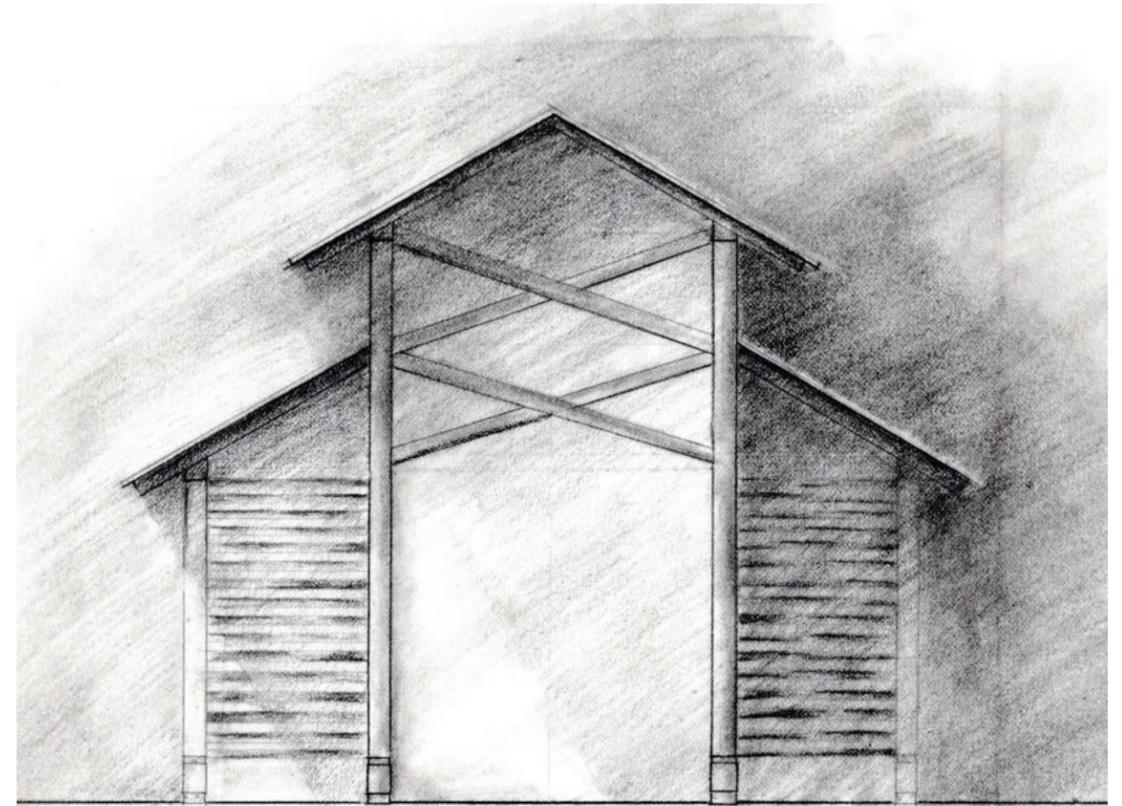

shrine

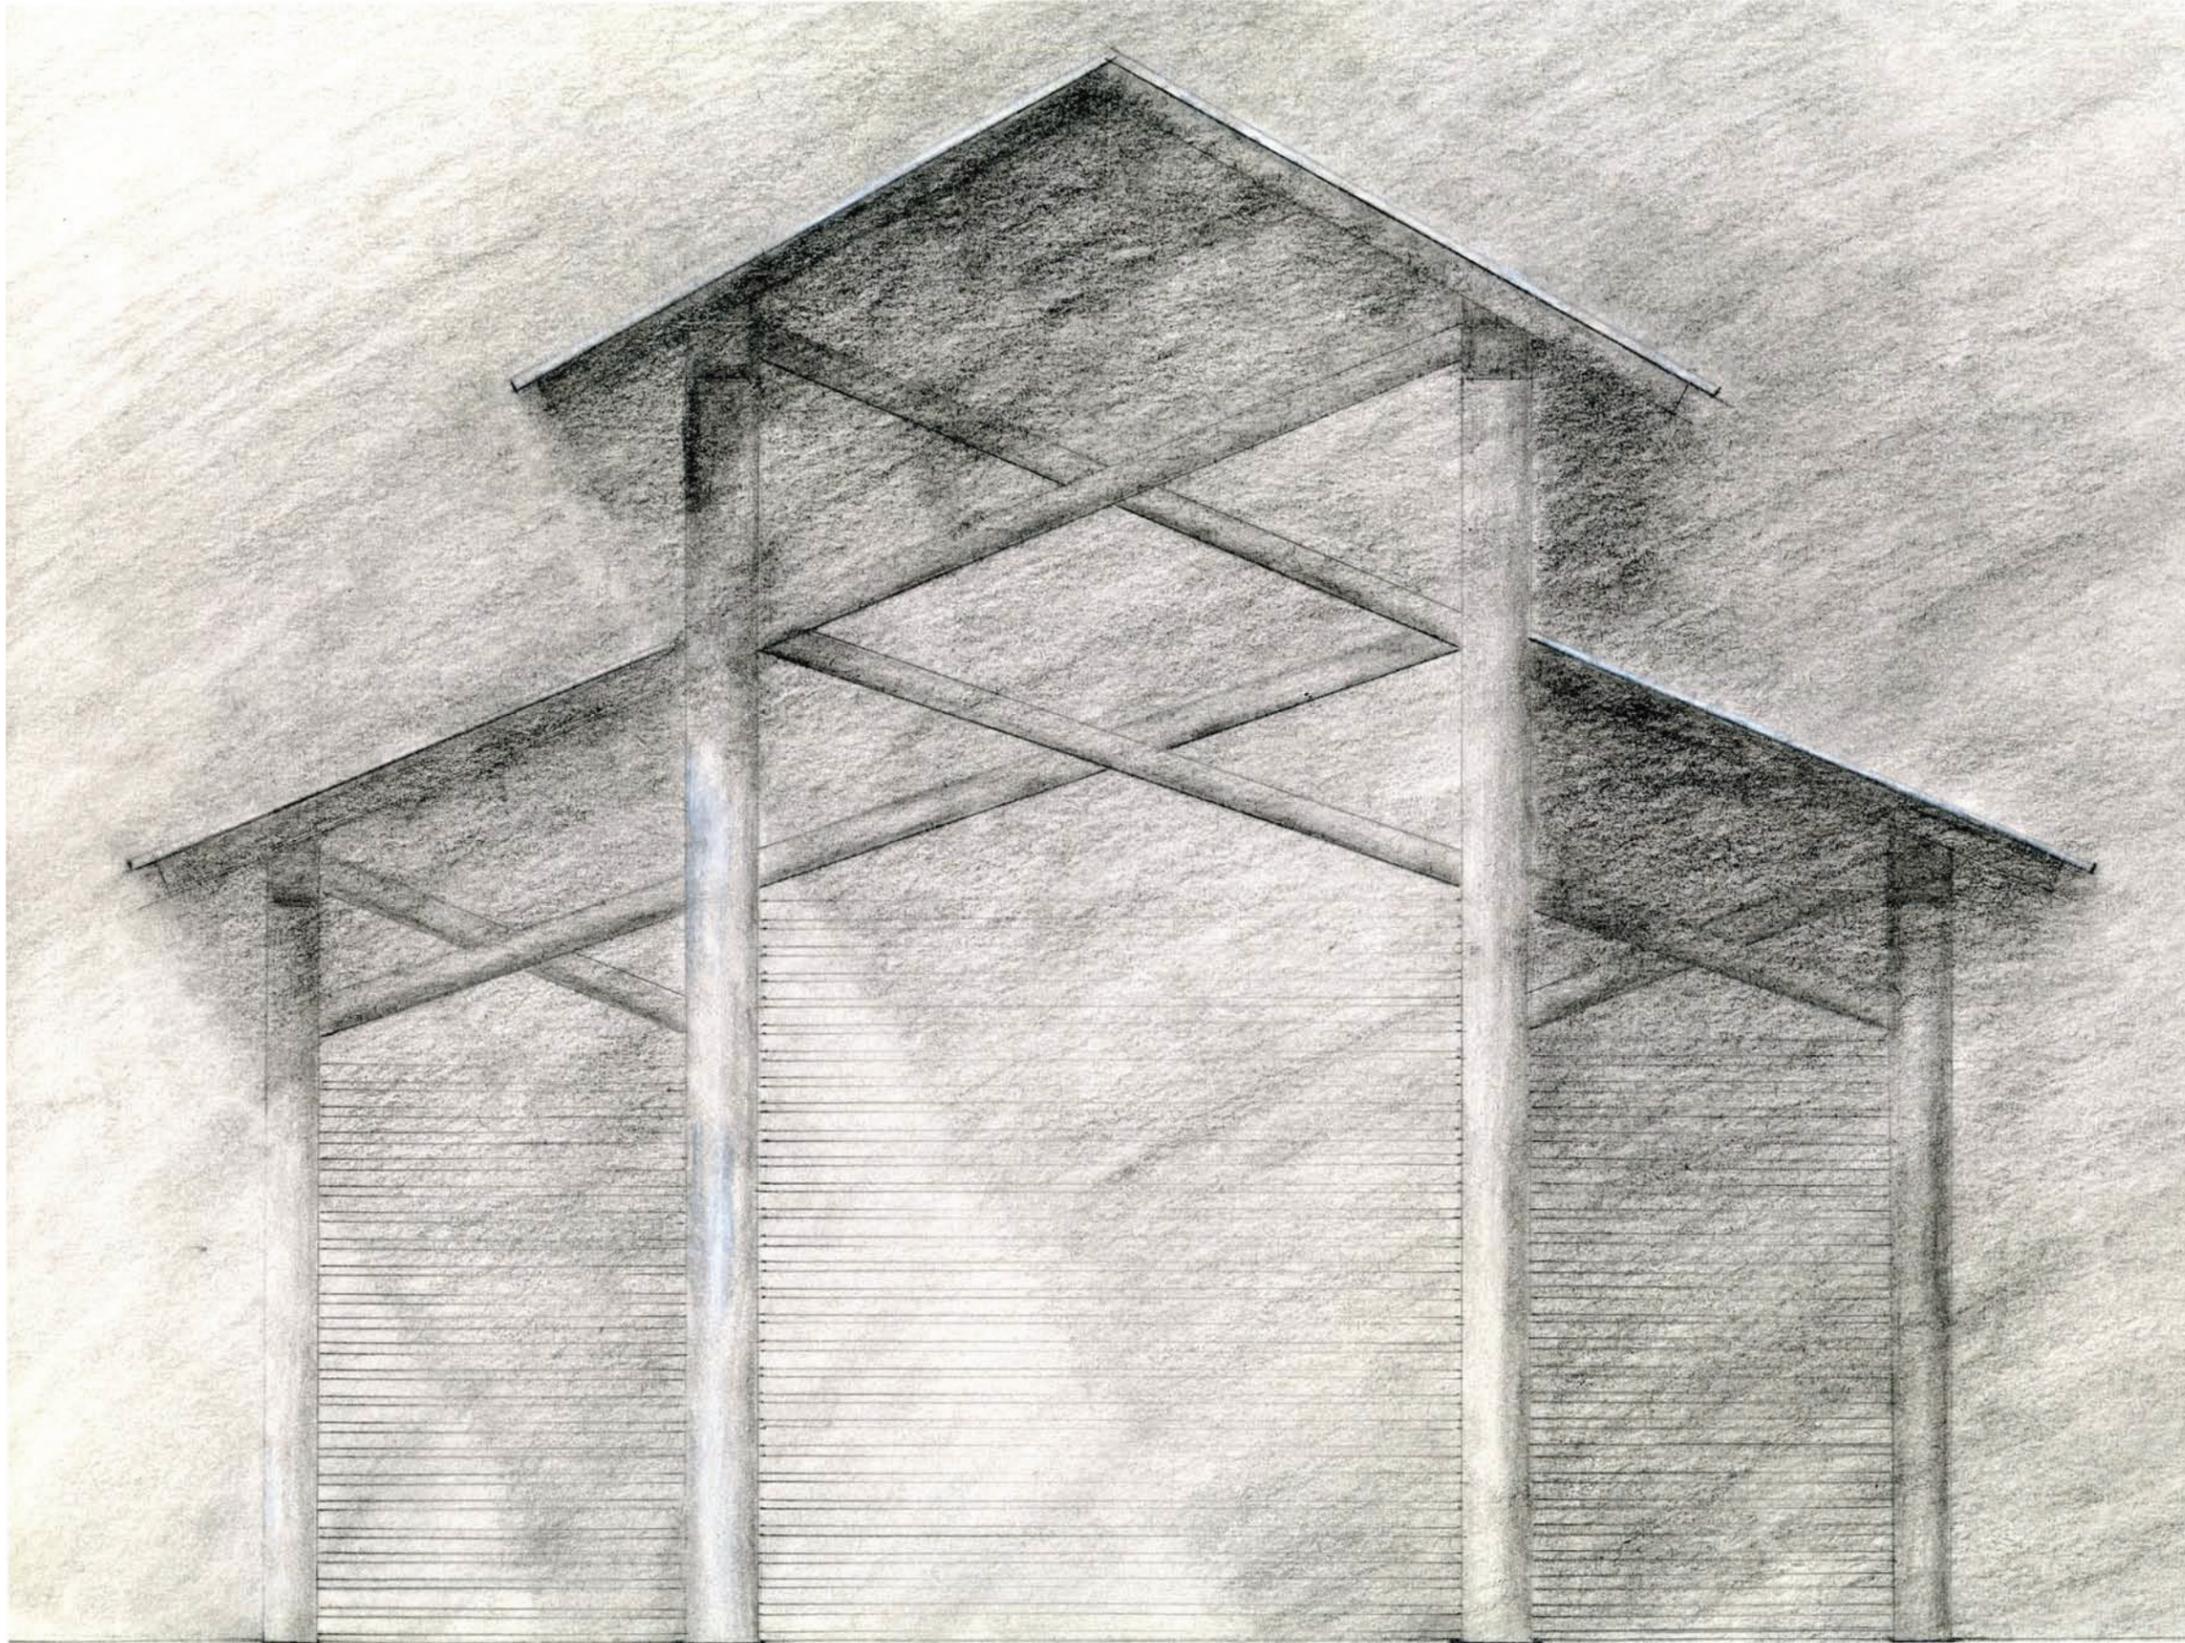

from the beginning, the size of the shrine for the Virgin Mary was an important factor that helped guide the rest of the design. The different studies were concentrated in finding the proper way to elevate the shrine and give a presence to it through the use of materials and varying roof heights.

material study

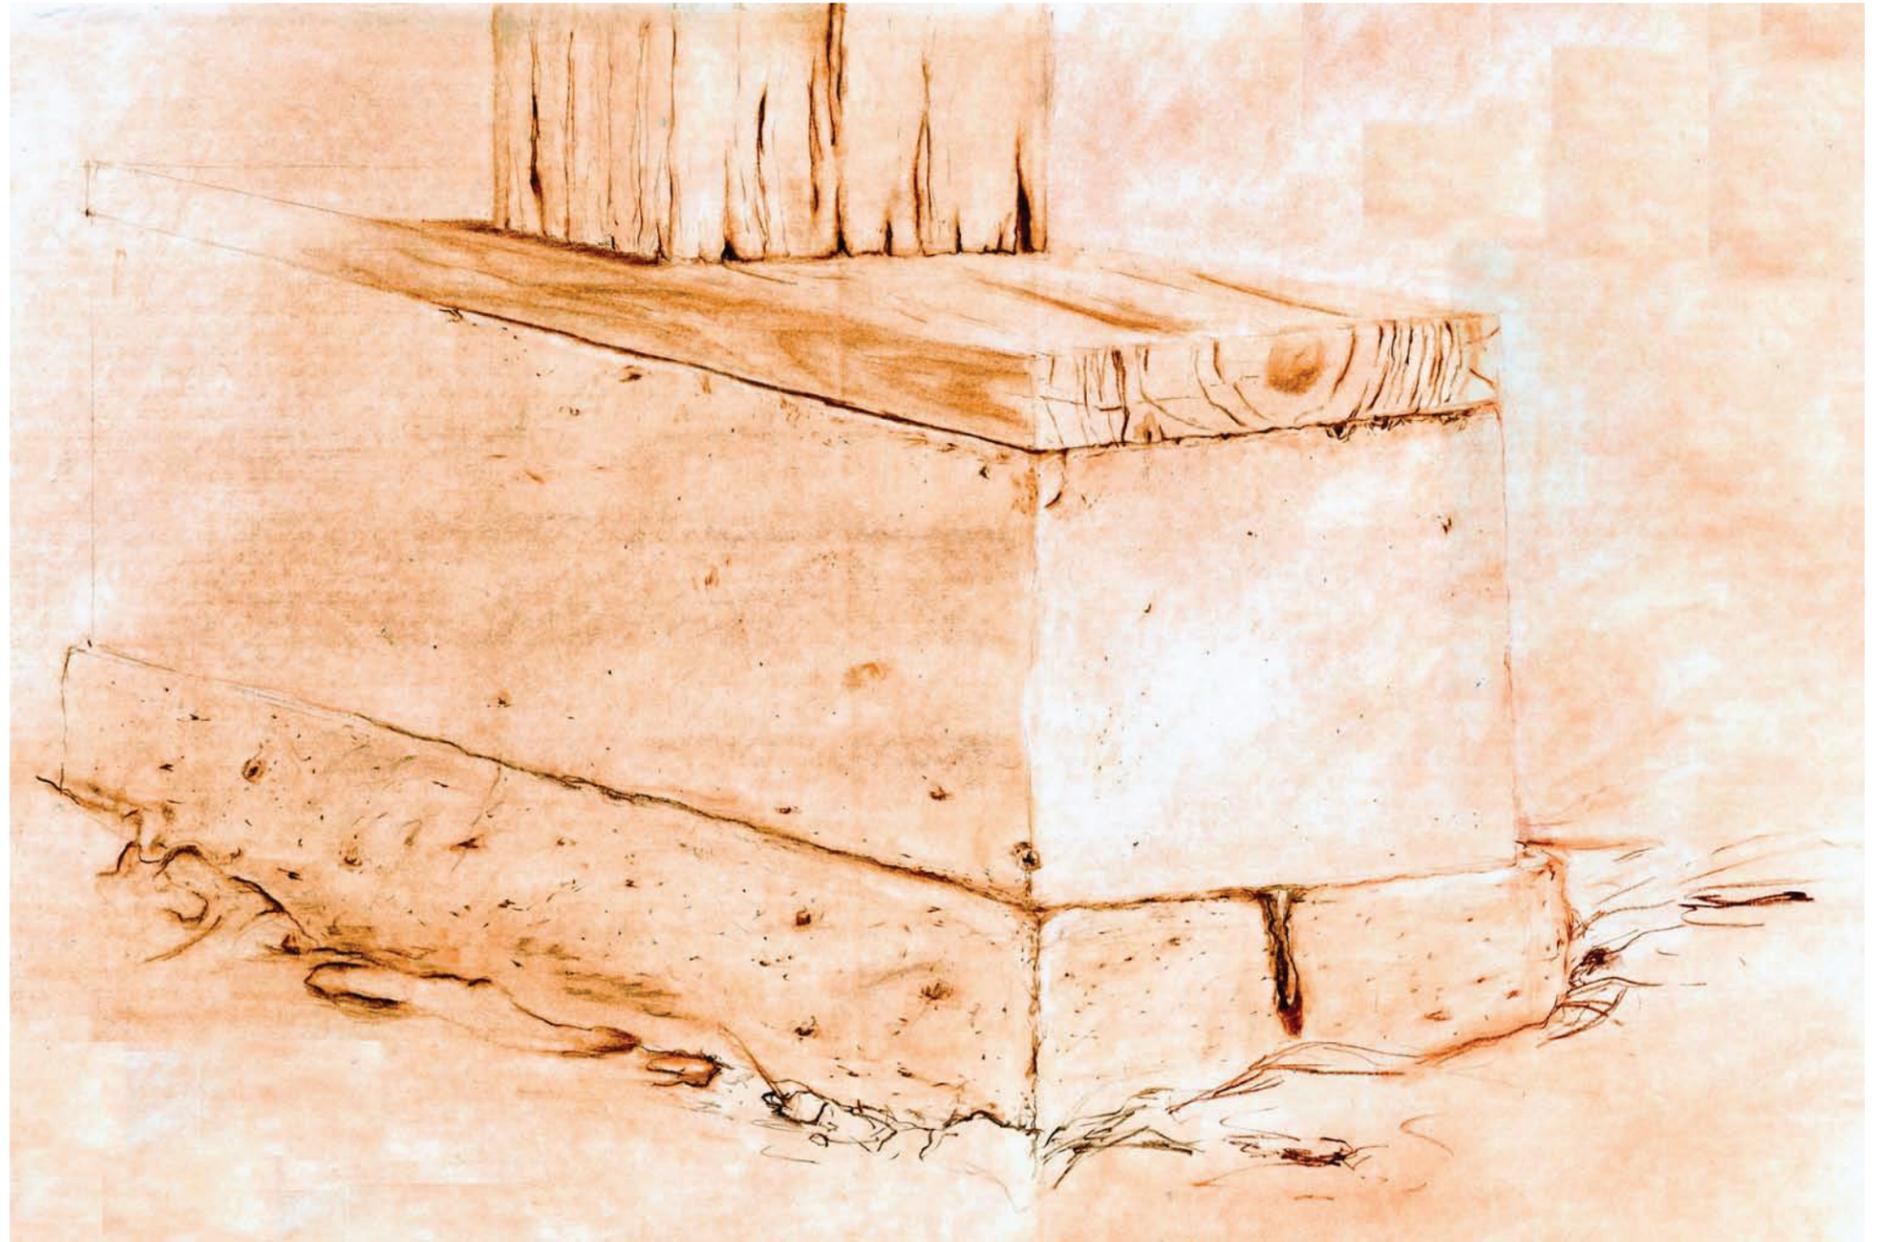

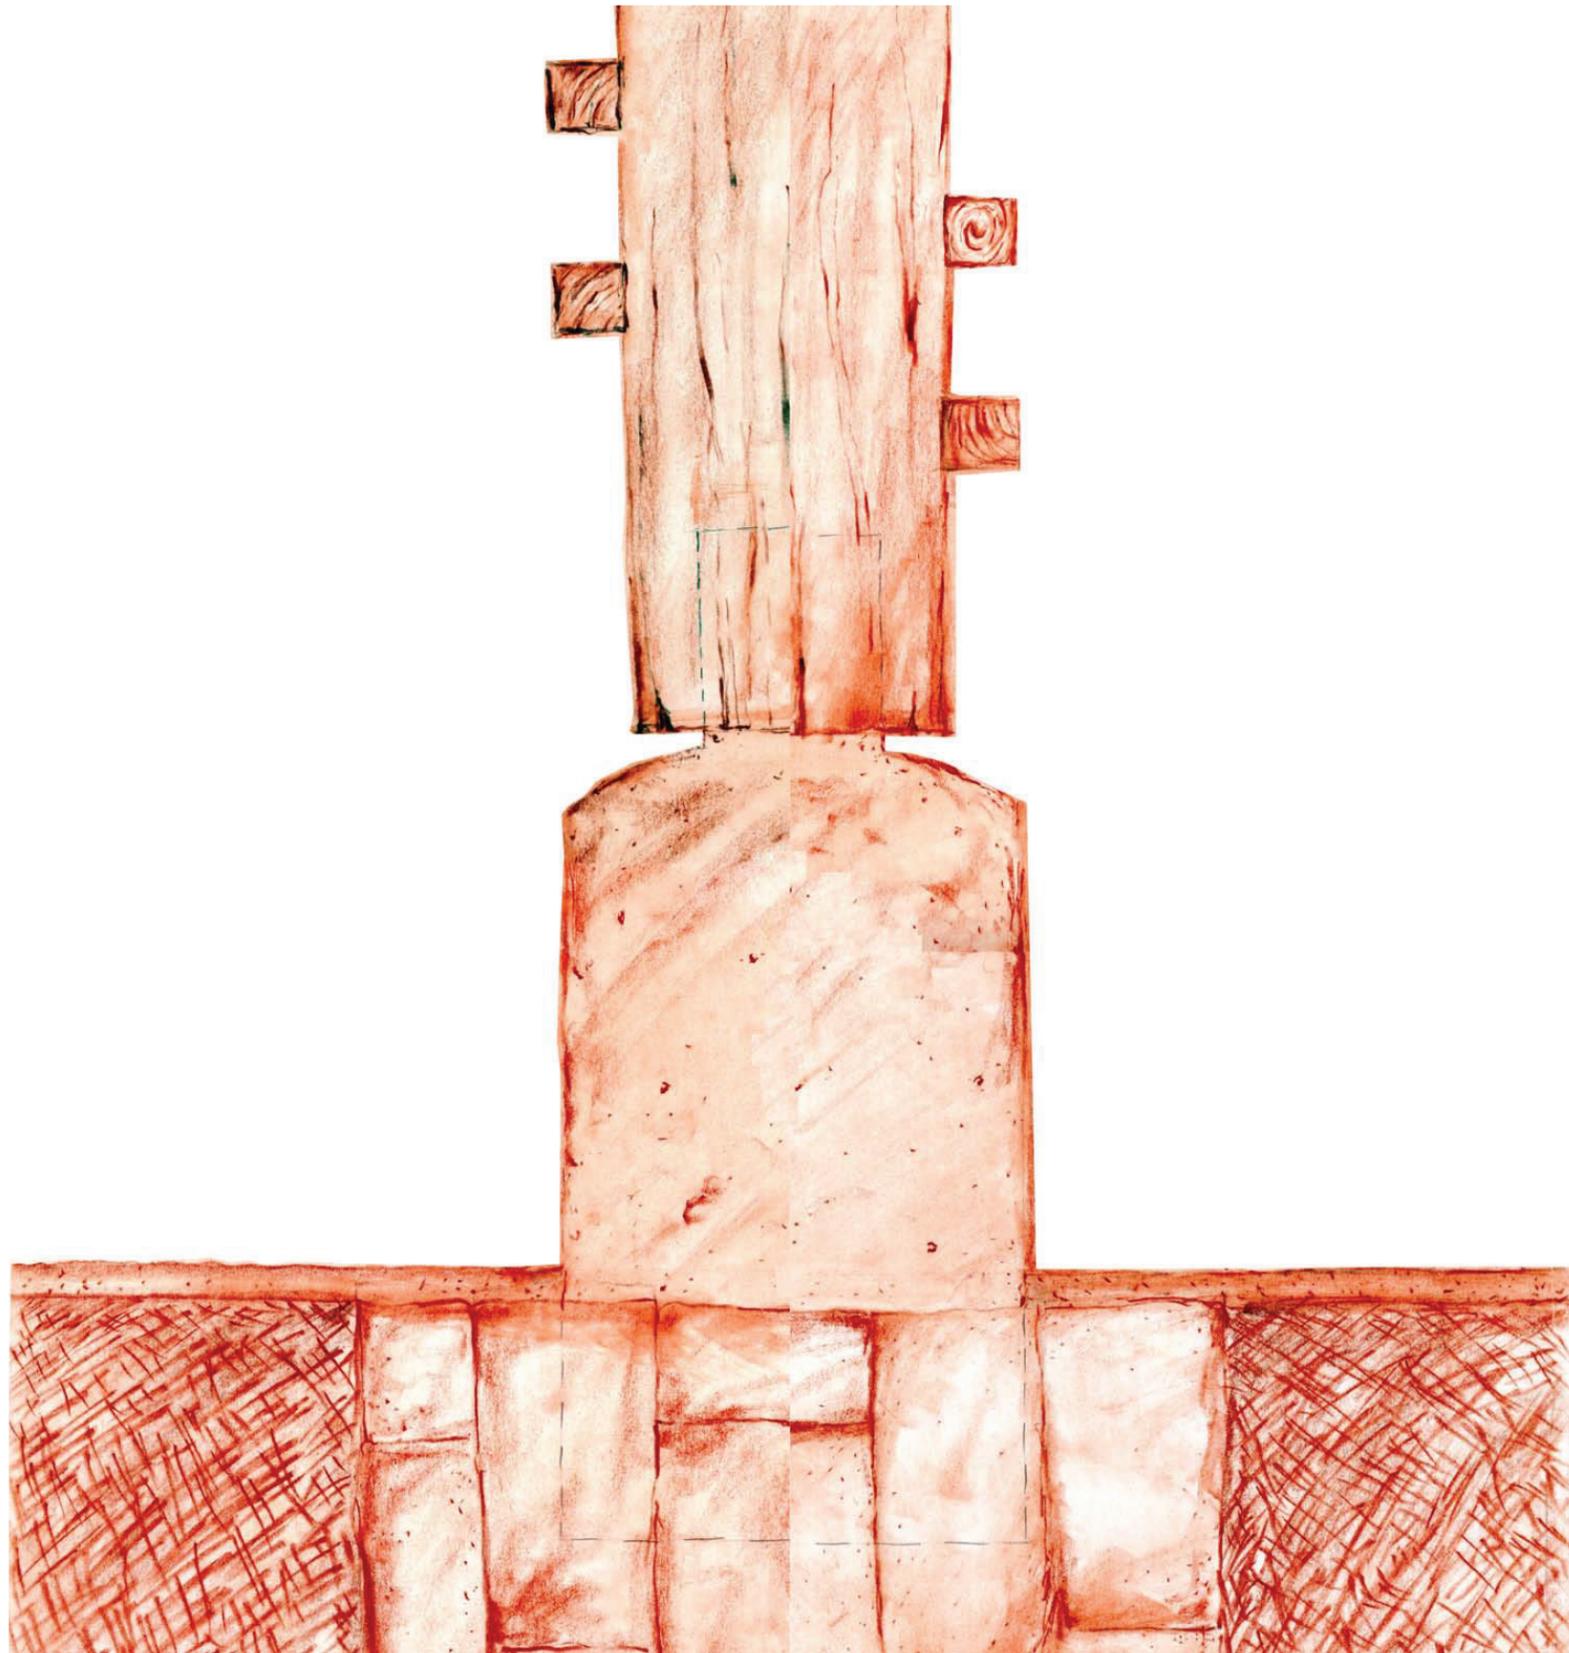

how the column met the ground was a condition that was continuously explored throughout the project. The materials chosen were readily available materials such as cmu, wood and concrete.

ceramic tile at pool

floor plan

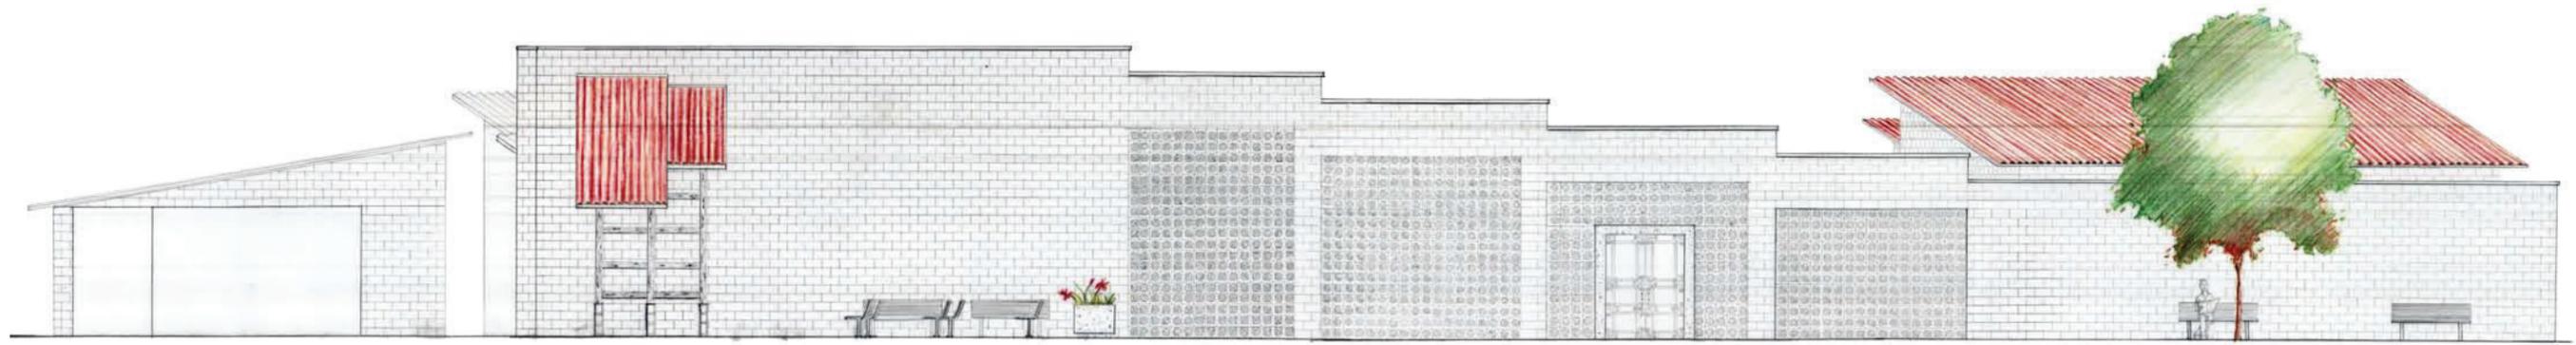

throughout the site, various sizes and types of ceramic tiles were used to distinguish the different areas. for the plaza, a traditional 8" octagonal paver is used. At the outdoor pool, a 2' x 2' grid of ceramic tile separates the pool area from the main path, which is composed of 4" x 4" tiles. in addition, the floor materials also contain distinctive textures that although subtle, help to enhance the overall experience of the users.

the sign of the cross is a common symbol in the catholic community, and can be seen mirrored through the floorplan. the main path leads the user from the main street of Benito Juarez to the street of Buena Suerte. the shorter path is a continuation of an existing one that runs through the community.

for the shrine space, I wanted to provide a separation between the plaza and the shrine without the need for walls. the solution was a simple rotation of the benches and flower beds to face the shrine, as well as a twenty two foot cmu wall that surrounds the shrine. the wall steps down as you walk further away from the shrine, reaching a final height of twelve feet at the entrance.
