European Cranberrybush Viburnum (Guilder Rose)

*Viburnum opulus*

Alex X. Niemiera, Associate Professor, Department of Horticulture

**Summary:**
- **Foliage:** 4-inch long 3-lobed leaves; deciduous
- **Height:** About 10 feet tall
- **Spread:** About 10 feet
- **Shape:** Upright, rounded habit; will sucker to form a thicket
- **Main features:** Cranberrybush viburnum is a large deciduous shrub with showy flowers in May and showy fruit for a few weeks in the fall; fall foliage color can be good but is inconsistent unless a cultivar is selected. There are several cultivars that are superior to the species (noted in the Additional Information section). This species is quite adaptable to an array of conditions (e.g., wet to dry soil, alkaline); older plants will sucker to form thickets. A few states list this species as an invasive species but NatureServe has not given this species an invasive ranking.

**Plant Needs:**
- **Zone:** 3 to 8
- **Light:** Full sun to part shade
- **Moisture:** Wet to dry
- **Soil type:** Adapts to most soils
- **pH:** Acid to alkaline

**Functions:**
- This species is somewhat informal in appearance and is best used in mass, in a border, or as a screen.

**Care:**
- No special care is needed with the exception of rejuvenation pruning older plants to reduce the sprawling, unkempt appearance.

**Additional Information:**
There are several cultivars in the trade that are superior to the species, a few are:
- ‘Compactum’ a dense, compact form that is about one-half of the size of the species (to 6 feet tall); has a good fall foliage color
- ‘Roseum’ this cultivar differs from the species in that it has a tremendous show of white globe-shaped flowers (species has lacecap-type flowers)
- ‘Xanthocarpum’ a compact form with yellow fruit

**American cranberrybush** (*Viburnum trilobum*) which is considered by some to be a subspecies of the European cranberrybush (*V. opulus*), hence listed as *V. opulus* var. *americanum* is quite similar to European cranberrybush viburnum. The American cranberry bush is best used in zones 2 to 6 (usually suffers from the heat of zone 7). Despite a flower and fruit show that rivals, and perhaps exceeds, European cranberrybush, American cranberry bush is less available than its European counterpart. There are several cultivars of American cranberrybush; in the event local garden centers do not carry this species (or cultivars thereof), one may have to obtain plants through a mail order nursery.
