ENERGY SERIES: What about Appliances?
Robert "Bobby" Grisso, Extension Engineer, Biological Systems Engineering
Martha A. Walker, Ph.D, Community Viability Specialist, Central District

Quick Facts
• The average annual energy cost of a home is about $1,900 and appliances are a major part of home energy use (ENERGYSTAR).
• By using appliances with energy saving features, you can save up to $80 in your energy cost every year (ENERGYSTAR).
• Some utility companies have buy-back programs for old appliances.

What should I look for when seeking an energy efficient appliance?
There are two key elements you need to look for when you shop for an energy efficient appliance: the ENERGY STAR logo and the EnergyGuide label.

What is an ENERGYSTAR logo?
ENERGYSTAR is a joint program of the U.S. Environmental Protection Agency (EPA) and the U.S. Department of Energy (DOE). The aim is to assist money savings and environmental protection by promoting energy efficient products and practices. Specific minimum standards and testing procedures of each type of product set the bar for meeting strict energy efficiency guidelines set by the EPA and DOE. If a product meets or exceeds the minimum standards, the product qualifies for the ENERGYSTAR label and can then be promoted as such (Figure 1).

![ENERGYSTAR logo](image)

Figure 1. Sample ENERGYSTAR logo for qualified products

Typically, ENERGY STAR qualified appliances use 10–50% less energy and/or water than their counterparts.

Do all type of appliances have ENERGY STAR guidelines or specifications?
No, not all appliance types are eligible to earn the ENERGYSTAR. For example, clothes dryers do not bear the ENERGYSTAR logo because there is
little quantifiable difference in energy use between models. Currently, only the following six appliance types have ENERGY STAR guidelines:

- Clothes washers
- Dehumidifiers
- Dishwashers
- Refrigerators and freezers
- Room air-conditioners
- Room air cleaners

See the ENERGY STAR web site for more information on specific appliances [http://www.energystar.gov/index.cfm?c=appliances.pr_appliances](http://www.energystar.gov/index.cfm?c=appliances.pr_appliances)

Manufacturers of these and many other appliance types must provide potential buyers pertinent information regarding a given product's energy consumption on the standardized EnergyGuide label.

**What is the EnergyGuide label?**

The EnergyGuide label (Figure 2) is a bright yellow tag that the Federal Trade Commission (FTC) developed to help consumers more easily compare energy efficiency among similar products.

![EnergyGuide label](image)

**Figure 2. Sample EnergyGuide label**

**Will I see the EnergyGuide labels on all products that use energy?**

No, not all products are required to display EnergyGuide labels. The FTC's Appliance Labeling Rule (implemented in 1980) requires placement of the EnergyGuide labels on any new product in the following product lines:

- Refrigerators
- Refrigerator-freezers and freezers
- Dishwashers
- Clothes washers
- Central air conditioners
- Room air conditioners
- Water heaters (some types)
- Heat pumps
- Furnaces
- Lighting products
- Fluorescent lamp ballasts
- Plumbing products

**What will the EnergyGuide label tell me?**

EnergyGuide labels for appliances contain three key pieces of information. First, the labels show the energy consumption or energy efficiency rating of the appliance, as determined from standard DOE tests. Second, some labels include a “range of comparability” indicating the highest and lowest energy consumption of efficiencies for all similar models. Third, labels for most appliances must provide estimated annual operating cost. Manufacturers arrive at this estimate by basing their calculations on figures published by the DOE.

Remember, EnergyGuide labels won't tell you the best appliance to buy, but they do provide a lot of information to help you in your decision making. They also help consumers assess the trade-offs between the energy costs of their appliances and other expenditures.

Make sure you compare similar models with similar capacities. For example, comparing one top-loading clothes washer with another top-loader that handles the same sized batch of laundry will help you make a more informed decision than comparing models that lack such similarities.

**Does an appliance with an EnergyGuide label also mean that it's ENERGYSTAR qualified?**

No, a product displaying an EnergyGuide tag does not mean the appliance is ENERGYSTAR qualified. Some manufacturers are incorporating the voluntary ENERGYSTAR logo on their qualified appliance EnergyGuide labels, but if you don't see the ENERGYSTAR logo on the bright yellow EnergyGuide tag, investigate further—the
ENERGYSTAR logo might be on the appliance itself, or perhaps the item hasn't earned the ENERGYSTAR.

What are some other, more general energy-saving tips for appliances?
If you want to keep your current appliances at their top efficiency, use the appliances as indicated in the product manuals, take care to avoid overrunning the appliances, and follow a regular maintenance schedule. When considering a new appliance, you can maximize your savings by:

• determining how much energy the appliance uses by going to the U.S. Department of Energy's Web site at: [http://www.eere.energy.gov/consumer/your_home/appliances/index.cfm?mytopic=10040](http://www.eere.energy.gov/consumer/your_home/appliances/index.cfm?mytopic=10040);

• checking with your local utility company to see if they offer rebates or incentives for the purchase of energy efficient appliances (a rebate makes that energy efficient dishwasher or refrigerator an even more attractive buy, and some utility companies even pay you to turn in older working inefficient models);

• visiting the ENERGYSTAR Web site at [http://www.energystar.gov/index.cfm?fuseaction= rebate.rebate_locator](http://www.energystar.gov/index.cfm?fuseaction= rebate.rebate_locator) to determine if there are any special offers or rebates available from ENERGYSTAR partners; and for potentially more savings,
