

Appendix N: Connection Test Yield Mode Tables

Appendix N contains tables, which categorize post-connection test lag screws into the appropriate yield mode. By noting the connection yield mode, a more concise understanding of connection behavior is enabled. Each of the two tables is presented according to species tested, Douglas-fir and spruce-pine-fir.

Nomenclature for group identification is, for example, DF1/2-1/8. This indicates crack length and area are for DF species using 1/2 in. diameter lag screws with 1/8 in. diameter pilot holes.
