INTRODUCTION

A total of 1262 requests were received in 2004. This report summarizes the activity of the Insect Identification Laboratory at Virginia Tech for 2004. The laboratory is located in 215 Price Hall. It is managed by Eric Day, Lab Manager, and Doug Pfeiffer, Extension Entomologist, Department of Entomology.

Of the samples received in 2004, 94% of the samples requested control recommendations.

Also from the samples received in 2004, 18% of the samples were forwarded from the Plant Disease Clinic, managed by Mary Ann Hansen. The remaining 82% were sent directly.

Specimens are identified and recorded in the lab, then sent for control recommendations and additional comments to Extension Entomologists who handle particular commodity groups. All specimen data are entered into the Insect I.D. Lab computer data base on the Virginia Tech mainframe computer. The data base greatly facilitates sorting and storage of the information. Some of the records were sent via microcomputer to the Cooperative National Plant Pest Survey and Detection Program (USDA, APHIS, PPQ). We at Virginia Tech acknowledge support provided by this program.

Whenever possible insects are identified to the species level. Common names are used where possible because of their wide recognition. To facilitate mailing

insects and insect damaged plant specimens to the lab, local offices of Virginia Cooperative Extension are provided with Insect Identification and Diagnosis Request forms (form 444-113), alcohol vials, and mailing tubes. Specimens also may be brought directly to the lab or mailed to:

Persons providing identifications and/or control recommendations:

Identifications and control recommendations covering most commodities performed by:

Mr. Eric R. Day

Manager, Insect Identification Laboratory

Timely and valuable identifications and/or control recommendations were also provided by:

Dr. Tom Kuhar	Assistant Professor of Entomology	Vegetable Pests
Dr. Richard D. Fell	Professor of Entomology	Apiculture and Stinging Insects
Dr. Dini Miller	Assistant Professor of Entomology	Structural and Household Insects

Dr. Ames Herbert	Associate Professor of Entomology	Soybeans, Small grains, Peanuts, and cotton
Mr. Steve Hiner	Technical Support Staff	Aquatic Insects and Invertebrates
Dr. Michael Kosztarab	Emeriti Professor of Entomology	Scale Insects
Dr. Threresa Dellinger	Post-Doctoral Staff	Entomology
Dr. Douglas G. Pfeiffer	Professor of Entomology	Fruit and Nuts
Dr. Scott Salom	Associate Professor of Entomology	Forest and Conifer
Dr. Peter Schultz	Station Director, Hampton Roads	Ornamentals
Dr. Paul J. Semtner	Professor of Entomology	Tobacco
Dr. J. Reese Voshell	Professor of Entomology	Aquatic Insects
Dr. Roger Youngman	Associate Professor of Entomology	Corn, Small grains, and Livestock

[Return to Table of Contents](#)

Activities: The following table lists the magnitude of activities and services provided by the Insect Identification Laboratory (IIL) and the faculty and staff associated with it since 1967.

Number of			

Specimens Identified			
Year	Identifications for Extension Agents and the Public	Identifications from Exotic Pest Surveys, Numbers of Traps Examined	Specimens sent to the Systematic Entomology Laboratory, USDA at Beltsville, Md. *

Insect Identification Laboratory
Department of Entomology
SURVEY PROGRAM

Virginia survey for *Pryeria sinica*, 2004. Results FIVE SITES WERE POSITIVE FOR *Pryeria sinica*, ALL OF THEM WERE IN THE CITY AND COUNTY OF FAIRFAX. 16 OTHER SITES WERE NEGATIVE FOR THIS MOTH IN LOUDOUN, PRINCE WILLIAM, AND ARLINGTON COUNTIES. Investigators: Eric R. Day, Department of Entomology, VPI&SU; Debbie Martin, VDACS; Beth McClelland, VDACS, Adria Bordas, VCE, VPI&SU; Beverly Harris (MG), Fairfax; Theresa Dellinger, Department of Entomology, VPI&SU. Narrative: In 2002 a moth was collected that was later determined to be *Pryeria sinica* (Lepidoptera: Zygaenidae). This moth collected in Fairfax County is a new North American record. It causes serious damage to *Euonymus* and is a potential pest of regulatory concern. Four survey trips were made to the site and nearby counties, in addition data from samples submitted to the extension office in Fairfax was collected. Also two presentations were made in Fairfax to professional landscapers and Master Gardeners but those contacts have not yielded additional records for *Pryeria*. Results: Five of 21 sites were positive for *Pryeria*. Botts property in Fairfax was the original site where the moth was first found and it continues to be found at that location. The second site was a site discovered in 2003 by the Extension agent, Adria Bordas, and the moths were found again in 2004 as well. The three remaining positive sites, Raftelis Road, Lakeside Oak, and Robins Nest Lane, are from samples submitted to the extension office in Fairfax in 2004. No *Pryeria* were found at the remaining sites but those *Euonymus* plantings were marked on a GPS for easy return in 2005. All GPS coordinates are listed below in the table. Data was entered into the NAPIS database on Nov. 23, 2004. Images, information, and a new distribution map can be viewed at the following site:

Status: P = Positive, found on site; N = Negative, not found

FUNNEL TRAP SURVEY FOR *TOMICUS PINIPERDA* IN VIRGINIA, WINTER 2003-2004. CURRENT STATUS: PINE SHOOT BEETLE (PSB) WAS NOT FOUND IN VIRGINIA IN 2004. Principal Investigators: Eric R. Day, Department of Entomology and Debra Martin, VDACS Narrative: *Tomicus piniperda* was detected in Clarke County on March 28, 2003 in a funnel trap baited with alpha-pinene. Rick Hoebeke at Cornell University confirmed the identification. The PSB has been collected and continues to be found in western panhandle region of Maryland (Allegheny, Garrett, Frederick, and Washington Counties) less than 20 miles from the Virginia state line. *T. piniperda* is known in the United States from seven states and until 2003 has not yet been found in Virginia. This insect has the potential to be a pest of pine (*Pinus* sp.) in Virginia and knowledge of its presence would aid in pest management and regulatory programs. It is currently regulated by a USDA, APHIS quarantine. Four Virginia counties (Frederick, Clarke, Loudoun, and Warren) were surveyed. A total of 27 traps were placed in four counties. *T. piniperda* fly when winter temperatures exceed 54° F.; thus traps were placed in the January 2004 and monitored until early July 2004. Traps were baited with alpha pinene lures obtained from a commercial source. All data regarding this survey has been uploaded to the NAPIS database in October, 2004. Work Plan: Traps were visited every approximately every 4 weeks from January to June. Personnel: VPI&SU: Eric R. Day, VDACS Personnel: Tom Finn, Tom Cary, Beth McClelland.

FUNNEL TRAP SURVEY FOR EXOTIC LONGHORNED BEETLES AND BARK BEETLES IN VIRGINIA CURRENT STATUS: THE TRAPPING IS COMPLETE AND THE TRAPS HAVE BEEN REMOVED. NO SUSPECT CERAMBYCIDS WERE COLLECTED, IN ADDITION NO IPS TYPOGRAPHUS WERE FOUND. Project Coordinators: Eric R. Day, VPI&SU. Bernetta Barco, USDA/APHIS/PPQ. Frank Fulgham, VDACS. Objective: Survey of warehouses and port facilities for exotic wood borers with particular emphasis on non-domestic longhorned beetles. In addition to enhance coverage to existing surveys for the Asian longhorned beetle and *Callidiellum rufipenne* the Cedar longhorned beetle. Benefits/Justification: Current surveys in Virginia,

conducted by APHIS and VDACS, are looking for *Callidiellum rufipenne*, the Cedar longhorned beetle (CLHB) and the Asian longhorned beetle (ALB). CLHB is currently found in North Carolina and Connecticut and a survey is being conducted using cedar logs. ALB is found in both New York and Illinois and a survey using baited funnel traps at selected warehouses is being conducted by VDACS. *Monochamus alternatus* was considered by the Virginia State Survey Committee to be the most dangerous of the listed exotic cerambycids because of Virginians pine based forestry industry coupled with international cargo ports of entry. Traps will be checked for all exotic beetles that have a potential of establishing in Virginia. This list includes *Anoplophora glabripennis* (the Asian longhorned beetle), *Anoplophora malasiaca*, *Callidiellum rufipenne*, *Hesperorphanes campestris*, *Monochamus alternatus*, and *Ips typographus*, although traps will be baited specifically for *Monochamus alternatus*. Materials and Methods: Port sites, warehouses, and storage areas with a foreign source of wooden shipping material were selected for this survey. Survey sites included warehouses that receive wood crating, pallets, and dunnage from foreign sources. Lindgren funnel traps were placed at each site and baited with a commercial lure for bark beetles and longhorned beetles. Each trap was set up with dry collection baskets and a killing agent (Vapona). Funnel traps were set up March 29-31 and samples were taken June 15-16 and were sampled again when the traps were taken down August 31. Additionally a trap was placed at the Virginia Inland Port (VIP) in Warren County and was checked during the Pine Shoot Beetle Survey. Screening of samples was done at VPI&SU and no suspect specimens were submitted to E. Richard Hoebeke for further identification. All data regarding the target insects of this survey has been uploaded to the NAPIS. Additional non-target insects may be uploaded later. Work Plan: Counties/Cities: 5., (Norfolk, Virginia Beach, Portsmouth, Richmond, and Warren) Monitoring agencies: Virginia Polytechnic Institute and State University (VPI&SU), Virginia Dept. of Agriculture and Consumer Services (VDACS). Total number of sites: 13, Traps per site: 1-3 each, Total traps: 24, Supplies: 12-unit Lindgren funnel traps, lure, alcohol, vials, and other survey equipment. Trap Setup: March 2004. Travel & Transportation: Traps were visited in June and again in late August of 2004.

II. UNFUNDDED SURVEYS

BROWN MARMORATED STINK BUG SURVEY FOR VIRGINIA 2004. CURRENT STATUS: THE BROWN MARMORATED STINK BUG, *HALYOMORPHA HALYS* HAS BEEN FOUND IN MONTGOMERY CO., VA. IT WAS TURNED IN AS PART OF A STUDENT COLLECTION FOR AN ENTOMOLOGY CLASS AT VIRGINIA TECH. PREVIOUSLY IT WAS NOT FOUND BY SURVEY IN WARREN, LOUDON, NOTTOWAY, CLARKE, OR FREDERICK COUNTIES NOR IN THE CITY OF WINCHESTER. Materials and Methods: Survey was made in September, October and November. Sites with late fruiting trees such as autumn olive, and/or soybeans were selected for sweep netting and visual inspection. All domestic stink bugs were collected at each location. RESULTS: No suspect stink bugs were found in any of the locations and no additional surveys were planned when the *Halyomorpha halys* was submitted with a student collection. All data have been uploaded onto the NAPIS database.

BANDED ELM BARK BEETLE SURVEY FOR VIRGINIA, 2004. CURRENT STATUS: NO SUSPECT BEETLES HAVE BEEN FOUND. Materials and Methods: Insects collected from the traps for the pine

shoot beetle survey were saved and are currently being screened for *Scolytus schevyrewi* Semenov. Currently only 50% of the samples have been checked but no suspect beetles have been found. When samples are finished positive and negative data will be uploaded onto the NAPIS database.
