

ACKNOWLEDGMENTS

One of the most altruistic attitudes is to contribute to the wealth and growth of young generations. I wish to express my gratitude to my advisor, Dr. Dushan Boroyevich, a professor who has dedicated his life to such a noble ideal, for his guidance, encouragement, remarkable patience and caring support during my graduate studies. His impressive knowledge, technical skills and creative thinking were the “power supply and control feedback” of this work.

I wish to thank my committee member, Dr. John S. Bay, for passing onto me the fundamental knowledge of the modern linear system theory, which helped me to understand better some phenomena throughout the course of this work.

I also thank my committee member, Dr. Jason Lai, for his contribution toward the completion of this work.

I am grateful to my professor, Dr. Fred C. Lee, for the experience of being a member of the Virginia Power Electronic Center, his teaching and his support during my graduate studies at Virginia Tech.

I would like to acknowledge VPEC students and staff for establishing an enjoyable working environment and for many constructive discussions.

Special thanks to Mr. Vojislav Stefanovic for the essential support and the initial idea of my studies at Virginia Tech, and for his wise and constructive advises.

I thank my beloved parents and my brother for their devoted love and constant support.

Finally, I would like to thank my wife Slavica for her love and tenacious support, and my son Nemanja for his love and tolerance for my frequent absence from his life. I thank my daughter Sonja for her every smile. This work is their legacy.
