

ACKNOWLEDGEMENTS

The author first and foremost thanks the Lord God Almighty for his constant love, protection, and the devotion he placed in her heart to persevere to the end.

The author began her Master of Science in Crop and Soil Environmental Sciences at Virginia Polytechnic Institute and State University in 2001 under the guidance and support of Dr. Charles Hagedorn III. Many people were instrumental in helping the author with her research project and the collection of the information for this thesis. She wished to acknowledge these individuals.

The author's research project was funded by a grant from the Virginia Department of Environmental Quality (VADEQ). Special thanks to Jutta Schneider for coordinating the project and for being very helpful, to Dr. Howard Kator at the Virginia Institute of Marine Science for filtering the samples, isolating the strains and his assistance, and to Dr. Bruce Wiggins from James Madison University for his support and assistance.

The author would like to sincerely thank and graciously appreciates the continued assistance and devotion of her committee chairman, Dr. Charles Hagedorn III, and her committee members, Dr. Raymond B. Reneau, Jr., and Dr. Matthew Eick. As the leader of the VADEQ project, Dr. Charles Hagedorn taught her many credible lessons regarding bacterial source tracking, which had a significance affect on her appreciation in the completion of her project. She appreciates the enthusiasm and support from her entire committee and appreciates their "open door" policy to her individual questions and concerns.

The author would like to thank the Division of Shellfish Sanitation (DSS),

Director Robert E. Croonenberghs, Ph.D., Shellfish Specialists, David B. Geeson, Richard M. Thomas, and Richard Morris for their assistance as well as their cooperation in allowing the author to join DSS on trips to both of the rivers.

The author appreciates all the help and support given by her fellow graduate student, Alexandria Graves. The laboratory technicians in Dr. Hagedorn's lab aided with technical and laboratory assistance. The author was able to conduct her own sampling collection, perform her own laboratory analysis, and tabulate her results in a timely fashion because of their assistance. Norma Nelson, Annie Brooks, and Emily Martin were all instrumental in the author's project aiding with data entry and laboratory procedures. Their assistance helped the author immensely and the author is truly grateful to them for all their hard work. Countless thanks to Ms. Sybil Phoenix, who many times answered questions and gave assistance to the author. The author would also like to personally thank Ms. Sue Brown for her astounding support and never doubting the author's abilities.

The author could not have accomplished this document without the constant support and "push" of her parents Frederick and Susan Szeles Jr. She is grateful to her parents for giving her the freedom, support, and encouragement throughout the completion of this Master of Science degree. Many times her parents have assured her and reminded of how proud they truly were of her. This verbal commitment allowed the author to concentrate and encouraged her not to lose sight of how far she has come and how close she was to her goals. The author is indebted to her grandparents, Frederick and

Florence Szeles Sr., her three sisters Lori Szeles, Julie Szeles, and Sandra Szeles, as well as, her fiancé Stephen Hawthorne, who all gave the author verbal and emotional support in her many times of need.
