What is Biotechnology?

Biotechnology includes new tools that were inspired by living things. We see examples of biotechnology in farming, manufacturing, and in medicine. This is very similar to biomanufacturing, but biotechnology focuses on specific tools. In these areas, biotechnology helps us change genes in living things to make them better. We can change genes to help plants grow better or to help people with genetic diseases. Each area of biotechnology does things a little bit differently.

Key terms

- **Biomanufacturing**: A process that produces commercially relevant biological materials.
- **Gene**: A collection of DNA found in chromosomes that controls what characteristics are passed on to a person, animal, or plant.
- **Genetic diversity**: the total number of genetic traits possible in a population of organisms.

Agricultural Biotechnology

In agriculture, biotechnology looks like genetically modified plants and animals. That means, scientists can make changes to the DNA of plants or animals, so they develop a certain way. This idea isn’t new. There are many types of apples. This is because we liked certain things about certain apples. Farmers selected those apples over others because their customers liked them more. Today, scientists can select specific genes. Scientists can pick genes to keep plants and animals healthy and increase the amount of food produced.
Medical Biotechnology

Medical biotechnology is like industrial biotechnology, but it focuses specifically on medicine. For example, we see fungi, like mushrooms, all the time. Well, some of these fungi can protect themselves from bacteria. This is just something they can do on their own. Some scientists thought the fungi might be able to help us too. By studying how the fungi protect themselves we can create medicine. This is how we got penicillin.

Industrial Biotechnology

Industrial biotechnology, sometimes called biomanufacturing, helps us make chemicals, energy, and materials. It can do this by using processes we find in nature and using them to help us. One example is cheese! Cheese starts out as milk, but how does it become cheese? Well, bacteria ferment it. Fermentation is a process in which bacteria, fungi, or yeast eat some chemicals and make them hotter. The bacteria make the milk hotter and make new chemicals, which turn the milk into cheese. A similar thing happens to bread and yogurt.

Connection to Cyberbiosecurity

Biotechnology can do some amazing things. A lot of those things we will eventually eat. This includes our lunches today, or medicines we take when we are sick. While most of the processes come from nature, we usually recreate the processes in a lab or factory. Those factories are run by computers. Making sure those computers stay protected is very important. If those computers are not working right, some people could get sick. Having people in charge of keeping those computers safe, keeps us safe too!
CAIA

Scientist Spotlight

Sabrina Amorim is an Animal Scientist with Master’s of Science in Genetics and Animal Breeding, and currently a Ph.D. Student in the School of Animal Sciences at Virginia Tech. Her research interest includes quantitative genetics and image analyses of high-throughput phenotyping data. She is interested in better understanding the genetic architecture of economically important traits in livestock and applying and developing ways to use statistics to predict the occurrence of traits. Sabrina is a CAIA Graduate Student Affiliate.

What is an Open Educational Resource?

What is an open educational resource?

The idea behind Open Educational Resources (OER) is simple but powerful — educational materials made freely and legally available on the Internet for anyone to reuse, revise, remix and redistribute. These digital materials have the potential to give people everywhere equal access to our collective knowledge and provide many more people around the world with access to quality education by making lectures, books, and curricula widely available on the Internet for little or no cost.

This definition of OER is provided by The William and Flora Hewlett Foundation.

How to access these templates

The main landing page for these resources is https://doi.org/10.21061/cyberbiosecurity.

This page includes a downloadable and editable Word document for the:
- Student fact sheet
- Student activity sheet
- Facilitator’s guide
