

# Copyright Information

Samantha V. Barron – PhD Dissertation, 2022

Each manuscript included in this (manuscript format) dissertation is currently available through either an arXiv pre-print, or journal within Springer Nature, the American Physical Society, or Wiley. In each case, use of published material is permitted provided certain conditions, which are all satisfied here. In all cases appropriate citations and copyright information is provided on the page preceding the start of each manuscript. I provide more information for each case in detail below.

Note: None of the publishers listed below require copyright letters of permission.

## Springer Nature

See “Author reuse” section on the link below:

“The author of articles published by Springer Nature do not usually need to seek permission for re-use of their material as long as the journal is credited with initial publication.”

“Authors have the right to reuse their article’s Version of Record, in whole or in part, in their own thesis. Additionally, they may reproduce and make available their thesis, including Springer Nature content, as required by their awarding academic institution.”

More Information:

<https://www.nature.com/nature-portfolio/reprints-and-permissions/permissions-requests>

Here, this applies to the following manuscripts:

- Chapter 7, page 61  
“Efficient symmetry-preserving state preparation circuits for the variational quantum eigensolver algorithm”
- Chapter 10, page 103  
“Gate-free state preparation for fast variational quantum eigensolver simulations”

## American Physical Society

See the FAQ below, which states:

“As the author of an APS-published article, may I include my article or a portion of my article in my thesis or dissertation?”

Yes, the author has the right to use the article or a portion of the article in a thesis or dissertation without requesting permission from APS, provided the bibliographic citation and the APS copyright credit line are given on the appropriate pages.”

More Information: <https://journals.aps.org/copyrightFAQ.html>

Here, this applies to the following manuscripts:

- Chapter 3, page 13  
“Microwave-based arbitrary CPHASE gates for transmon qubits”
- Chapter 8, page 71  
“Preserving symmetries for variational quantum eigensolvers in the presence of noise”
- Chapter 5, page 41  
“Fast high-fidelity entangling gates for spin qubits in Si double quantum dots”
- Chapter 11, page 115  
“Preparing bethe ansatz eigenstates on a quantum computer”
- Chapter 12, page 132  
“Qubit-adapt-vqe: An adaptive algorithm for constructing hardware-efficient ansätze on a quantum processor”
- Chapter 13, page 149  
“Adaptive quantum approximate optimization algorithm for solving combinatorial problems on a quantum computer”

## arXiv preprints

All arXiv preprints in this dissertation are published with the Creative Commons license.

More Information: <https://arxiv.org/help/license>

Here, this applies to the following manuscripts:

- Chapter 4, page 25  
“A universal quantum gate set for transmon qubits with strong ZZ interactions”
- Chapter 6, page 53  
“Measurement Error Mitigation for Variational Quantum Algorithms”
- Chapter 14, page 159  
“Scaling adaptive quantum simulation algorithms via operator pool tiling”
- Chapter 15, page 166  
“ADAPT-VQE is insensitive to rough parameter landscapes and barren plateaus”

## Wiley

See the FAQ below, which states:

“Do I need to request permission to use my own work as my dissertation?”

If you are the author of a published Wiley article, you have the right to reuse the full text of your published article as part of your thesis or dissertation. In this situation, you do not need to request permission from Wiley for this use.

If your institution still requires a reuse license in this case, follow the steps below to request your license via RightsLink.”

More Information:

<https://www.wiley.com/network/researchers/latest-content/how-to-clear-permissions-for-a-thesis-or-dissertation>

Here, this applies to the following manuscripts:

- Chapter 9, page 87  
“Benchmarking quantum chemistry computations with variational, imaginary time evolution, and krylov space solver algorithms”
