Fair Use Determination of copyright materials for Design of a Resonant Snubber for Photovoltaic Inverter Systems

Government websites for public programs, application notes, and datasheets are cited from several different companies and discussed in text. The information used in the thesis falls under the fair use definition of US Code, Title 17, Sect. 107 by fulfilling the four fair use factors.

1. Purpose and character of use.

The material used is for commentary of the information or technology to discuss the current state of photovoltaics or specific technology. The information used is only to compare my work on the resonant snubber inverter to existing solutions.

2. Nature of the copyrighted work.

All copyrighted material used is readily available online for public consumption. All information cited is technical information about operation and performance from freely available and widely known information in technical communities. All copyright materials are designed for public consumption.

3. Amount, Substantiality.

Copyrighted material cited is only used to establish previous work and compare my experimental results to other work. The amount used is small, is minimal from the copyrighted source, and not used where I claim original work.

4. Effect

Material cited is available for anyone to view through websites hosted by the copyright holders. The copyright material cited is designed for public consumption.

All figures used were created by the author for this thesis, with work relating to any relevant figure cited in the text that accompanies them.
