BEHAVIOR AND STRENGTH OF WELDED STUD SHEAR CONNECTORS

by

Michelle Deanna Rambo-Roddenberry

W. Samuel Easterling, Chairman

Civil Engineering

(ABSTRACT)

The behavior and strength of welded shear studs are subjects of ongoing study. In recent years, research has shown that the American Institute of Steel Construction (AISC) specification equations for shear stud strength are unconservative for studs placed in deck with ribs transverse to the steel beam. Twenty-four solid slab push-out tests, 93 composite slab push-out tests, and bare stud tests were performed to study the effects on stud strength of friction, normal load, position of studs in the ribs of steel deck, concrete strength, and stud properties. Stud diameters ranged from 3/8 in. to 7/8 in., deck heights ranged from 2 in. to 6 in., and both single and pairs of studs were tested. The push-out test results from this study were combined with other studies to propose a new stud strength prediction model. Three new beam tests were performed to study the effect of the stud position in the ribs of the steel deck. The results of these tests, along with 61 other beam tests, were used to verify the new stud strength prediction model. A reliability study was performed to determine resistance factors for stud strength and beam strength.

ACKNOWLEDGMENTS

The author would like to thank Dr. W. Samuel Easterling for his endless support, encouragement, and patience. The completion of this dissertation has been a journey, and Dr. Easterling has been an ideal traveling companion. She would also like to thank Dr. Thomas Murray for his humorous outlook on life and for always giving the best advice. A special thanks goes to Dr. Siegfried Holzer, Dr. Kamal Rojiani, and Dr. Thomas Cousins for serving on her committee and for always welcoming questions. Thanks also to all faculty members in the Structures Division, including Dr. Richard Barker, for sharing their many years of wisdom and providing the best education possible. They have all been an inspiration.

The experimental work and test specimen preparation would not have been possible without the help from Brett Farmer and Dennis Huffman. Thanks to both of them for being so reliable, helpful, and fun to work with. Thanks also to the research assistants who all worked as a team, helping each other in the lab – there are too many to name them all. Thanks to Sarah Carr and Brian Diaz for helping with many of the push-out tests.

The author would also like to thank her parents, Norman and Barbara Rambo, for believing in her and for encouraging her to continue her education. She would also like to thank her husband for his ongoing support and her son for his smiles and unconditional love.

This research has required a great amount of financial support. Thank you to the Via family and the Charles E. Via, Jr. Department of Civil and Environmental Engineering for granting the fellowship that made studying and researching possible. Thank you to the American Institute of Steel Construction, American Iron and Steel Institute, NUCOR Research and Development, Steel Deck Institute, Tru-fit Corporation and TRW Nelson Stud Welding Division for sponsoring this research.

A final thank you to the many researchers at Virginia Tech and around the world who have studied the topic of shear studs over the past few decades. The world is blessed with some truly gifted engineers, whose ideas and methodologies blend to constantly improve the state-of-the-art.

TABLE OF CONTENTS

Abstract	ii
Acknowledgments	iii
List of Figures	ix
List of Tables	xii
Chapter 1 Introduction	1
1.1 Background.....	1
1.2 Literature Review.....	8
1.3 Scope of Research.....	41
Chapter 2 Push-Out Specimen Configuration and Test Procedures	43
2.1 Introduction.....	43
2.2 Test Matrices.....	43
2.2.1 Solid Slab Push-Out Tests.....	43
2.2.1.1 Effect of Flange Thickness (Series 1-4).....	45
2.2.1.2 Effect of the Steel/Concrete Interface (Series 5-6).....	45
2.2.1.3 Effect of Applying Normal Load (Series 7-8).....	46
2.2.2 Composite Slab Push-Out Tests.....	46
2.2.2.1 Effect of Stud Diameter, Concrete Strength, and Deck Height.....	48
2.2.2.2 Effect of Friction at the Deck/Beam Interface.....	48
2.2.2.3 Effect of Tension in the Stud Shank.....	48
2.3 Test Specimen Configuration and Construction.....	49
2.3.1 General.....	49
2.3.2 Solid Slab Specimens.....	49
2.3.3 Composite Slab Specimens.....	50
2.4 Loading Method and Instrumentation.....	54
2.5 Test Procedure.....	60
Chapter 3 Push-Out Test Results	62
3.1 Solid Slab Push-Out Test Results.....	62
3.2 Composite Slab Push-Out Test Results.....	64
3.3 Discussion of Solid Slab Push-Out Test Results.....	64
3.3.1 Effect of Flange Thickness.....	64
